Characterization of Municipal Solid Waste Incinerator Residues for Utilization: Leaching Properties H. A. van der Sloot,G. J. de Groot,1990 *Eco-efficient concrete* M. Tyrer,2013-02-04 The potential to use municipal waste incineration products in concrete has been examined over many years both as a source of aggregates and as supplementary cementitious materials SCM With an understanding of the chemical evolution of these materials in the cement environment both applications provide routes to the re use of these materials in construction Fly ashes and air pollution control residues must be washed to remove their considerable chloride content before use after which the remaining solids largely aluminosilicates may replace some fraction of the cementitious binder Care must be taken when using these materials as SCMs as volatile heavy metals present in the original waste may be concentrated in the fly ash The bottom ashes from municipal solid waste MSW incineration also show sufficient pozzolanic reactivity when finely ground to replace some cement in the binder phase They may also serve directly as aggregate in concrete although the irregular and angular particle shape may reduce its workability somewhat Most MSW bottom ashes contain sufficient free aluminium to disrupt the setting reactions of the binder through hydrolysis reactions at high pH Consequently this must be removed or reacted by pre treatment prior to use in concrete and means of doing so are described here Slower detrimental reactions are also known such as alkali silica reaction especially of container glass fragments and these are considered here Lastly the use of MSW incineration products in manufactured aggregates is described comparing sintering melting and recrystallization and plasma processing with low temperature methods such as rapid carbonation technology *An International Perspective on Characterisation and Management of Residues from Municipal Solid Waste Incinerator Residues* A. Characterization and Utilization of Municipal and Utility Sludges and Ashes:

Municipal incinerator residues Norman L. Hecht, D. S. Duvall, 1975 BAT for combustion and incineration residues in a Circular Economy Hjelmar, Ole, Hyks, Jiri, Korpijärvi, Kirsi, Wahlström, Margareta, Grönholm, Raul, 2022-09-28 Available online <https://pub.norden.org/temanord2022/542> Combustion of biomass and incineration of solid waste and sewage sludge are important parts of the energy production and waste management infrastructure in most of the Nordic countries but they also produce substantial quantities of residual waste in terms of bottom ash, fly ash and flue gas cleaning residues which contain potentially harmful substances in various amounts. Preferably the ashes and residues should be treated and utilised as part of the Circular Economy. The project provides an overview of the utilisation options including environmental and treatment requirements and of the associated technical and regulatory frameworks and practical conditions of utilisation. Compliance of combinations of treatments and applications of ashes and residues with Best Available Techniques (BAT) has been assessed and seven Nordic BAT candidates have been proposed and described in detail. *Waste Incineration and Public Health* National Research Council, Commission on Life Sciences, Board on Environmental Studies and Toxicology, Committee on Health Effects of Waste Incineration, 2000-09-21 Incineration has been used widely for waste disposal including household hazardous and medical waste but there is increasing public concern over the benefits of combusting the waste versus the health risk from pollutants emitted during combustion. Waste Incineration and Public Health informs the emerging debate with the most up to date information available on incineration pollution and human health along with expert conclusions and recommendations for further research and improvement of such areas as risk communication. The committee provides details on processes involved in incineration and how contaminants are released. Environmental dynamics of contaminants and routes of human exposure. Tools and approaches for assessing possible human health effects. Scientific concerns pertinent to future regulatory actions. The book also examines some of the social psychological and economic factors that affect the communities where incineration takes place and addresses the problem of uncertainty and variation in predicting the health effects of incineration processes. **Evaluation of Cement, Lime, and Asphalt Amended Municipal Solid Waste Incinerator Residues** Peter J. Holland, AIR FORCE INST OF TECH WRIGHT-PATTERSON AFB OH., 1989 The ability of type II portland cement hydrated lime and AC 10 asphalt to solidify/stabilize municipal solid waste (MSW) incinerator residues was evaluated. Leachate withdrawal was controlled at 0.13 ml/min until final liquid/solid ratios of 0.6/0.4 and 0.9 were achieved in the cement/lime and residue control columns respectively. The leachates were analyzed for metal (Pb, Ni, Zn, Al, Ca, Mn, Na, Cd, Cu, Fe) and anion (Cl, SO₄, NO₃, PO₄, Br) concentrations, alkalinity, pH, redox potential and conductivity. Successful immobilization of all tested metals except lead, aluminum and nickel were seen in the cement amended leachates while only zinc and manganese were leached from the lime amended columns in concentrations exceeding those found in the residue control. The test results revealed little differences in metal mobility between wastes of varying percent amendment addition. In general, cement, lime and asphalt amended residues demonstrated

reduced mobility for cadmium manganese and aluminum relative to the concentrations measured in the control leachates Compressive strength tests were performed on replicate specimens of all cement lime and asphalt amended matrices as a measure of residue solidification Theses AW Combustion Ash Residue Management Richard W. Goodwin, 2013-12-05 Combustion Ash and Residue Management assists owners and operators of Coal fired and Resource Recovery Power Plants By applying the principles and reviewing the case studies examples described within this book accidents and upsets can be avoided and regulatory permitting can be achieved reducing costs This unique book is an essential reference for anybody responsible for disposal or utilization of combustion residues It reflects over 30 years of engineering practice applying the principles of concrete chemistry and civil engineering soil mechanics as confirmed by field data Dr Richard Goodwin assesses the composition and environmental impact of combustion residues and provides not only best practices for safe disposal but also a blueprint for effective reuse including applications like structural fill grout and capping material Case studies and cost information for ash disposal options are included in addition to the lessons learned by high profile failures such as the TVA Kingston fossil plant coal fly ash slurry spill in 2008 It also applies engineering principles to discuss how to avoid future upsets including better operator training and monitoring methods A comprehensive update to reflect changes in legislation and practice including new material on the safe disposal or beneficial use of coal ash A straightforward engineering approach providing practical guidance and field data Written by an established expert in the field
