100 Years Of Relativity: Space-time Structure -

Einstein And Beyond Abhay Ashtekar, 2005-11-22 Thanks to Einstein's relativity theories our notions of space and time underwent profound revisions about a 100 years ago. The resulting interplay between geometry and physics has dominated all of fundamental physics since then. This volume contains contributions from leading researchers worldwide who have thought deeply about the nature and consequences of this interplay. The articles take a long range view of the subject and distill the most important advances in broad terms making them easily accessible to non specialists. The first part is devoted to a summary of how relativity theories were born. J Stachel. The second part discusses the most dramatic ramifications of general relativity such as black holes. P Chrusciel and R Price. space time singularities. H Nicolai and A Rendall. gravitational waves. P Laguna and P Saulson. the large scale structure of the cosmos. T Padmanabhan. experimental status of this theory. C Will as well as its practical application to the GPS system. N Ashby. The last part looks beyond Einstein and provides glimpses into what is in store for us in the 21st century. Contributions here include summaries of radical changes in the notions of space and time that are emerging from quantum field theory in curved space times. Ford. string theory. T Banks. loop quantum gravity. A Ashtekar. quantum cosmology. M Bojowald. discrete approaches. Dowker. Gambini and Pullin. and twistor theory. R Penrose.

Gravitational Solitons V. Belinski, E. Verdaguer, 2001-07-19 This 2001 book gives a self contained exposition of the theory of gravitational solitons and provides a comprehensive review of exact soliton solutions to Einstein's equations. The text begins with a detailed discussion of the extension of the Inverse Scattering Method to the theory of gravitation starting with pure gravity and then extending it to the coupling of gravity with the electromagnetic field. There follows a systematic review of the gravitational soliton solutions based on their symmetries. These solutions include some of the most interesting in gravitational physics such as those describing inhomogeneous cosmological models, cylindrical waves, the collision of exact gravity waves and the Schwarzschild and Kerr black holes. A valuable reference for researchers and graduate students in the fields of general relativity, string theory and cosmology, this book will also be of interest to mathematical physicists in general.

Applications of Knot Theory American Mathematical Society. Short Course, 2009 Over the past 20-30 years knot theory has rekindled its historic ties with biology, chemistry and physics as a means of creating more sophisticated descriptions of the entanglements and properties of natural phenomena from strings to organic compounds to DNA. This volume is based on the 2008 AMS Short Course Applications of Knot Theory. The aim of the Short Course and this volume while not covering all aspects of applied knot theory is to provide the reader with a mathematical appetizer in order to stimulate the mathematical appetite for further study of this exciting field. No prior knowledge of topology, biology, chemistry or physics is assumed. In particular the first three chapters of this volume introduce the reader to knot theory by Colin Adams, topological chirality and molecular symmetry by Erica Flapan and DNA topology by Dorothy Buck. The second half of this volume is focused on three particular applications of knot theory. Louis Kauffman discusses applications of knot theory to physics. Nadrian Seeman discusses how topology is used in DNA nanotechnology and Jonathan Simon discusses the statistical and energetic properties

Harmonic Superspace A. S. Galperin, E. A. Ivanov, V. I. Ogievetsky, E. S. Sokatchev, 2001-09-27. This is a pedagogical introduction to the harmonic superspace method in extended supersymmetry. Inspired by exciting developments in superstring theory, it provides a systematic treatment of the quantum field theories with $N=2$ and $N=3$ supersymmetry in harmonic superspace. The authors present the harmonic superspace approach as a means of providing an off-shell description of the $N=2$ supersymmetric theories both at the classical and quantum levels. Furthermore, they show how it offers a unique way to construct an off-shell formulation of a theory with higher supersymmetry, namely the $N=3$ supersymmetric Yang-Mills theory. Harmonic Superspace makes manifest many remarkable geometric properties of the $N=2$ theories, for example, the one-to-one correspondence between $N=2$ supersymmetric matter and hyper-Kähler and quaternionic manifolds. This book will be of interest to researchers and graduate students working in the areas of supersymmetric quantum field theory, string theory and complex geometries.
