Cortical Bone Healing after Internal Fixation and Infection W.W. Rittmann,S.M. Perren,2012-12-06 The danger of infection remains the most serious drawback to internal fixation Prevention using all available prophylactic measures should be the central feature in every surgical department Though the infection rate may remain below the acceptable level of 2 % the infected patient derives little comfort from the large number of excellent results in other people We must discover the best way to offer these patients a favourable prognosis This should not be based on intuition but on clear proven guiding principles Planning the treatment for a patient whose internal fixation has become septic must decide between steps which may have advantages or disadvantages The disadvantage of the presence of a foreign body must be weighed against the advantage of rigidity The authors have taken up this challenge by planned animal experiments to study the healing of internally fixed fractures which have been infected with staphylococci They have shown that under stable conditions even massive infection did not destroy the healing process in cortical bone Even under these circumstances fracture union in the form of primary bone healing can occur even if with less regularity than in uninfected internal fixation **Prize Essays on**
