

Tribal Management of Onsite Wastewater Treatment Systems

Onsite Wastewater Management Steps:

- Map
- Design
- Maintain
- Regulate

To protect public health and water quality, states and local governments across North America establish regulations for the safe and appropriate use of OWTS. OWTS can provide effective sewage treatment, if sited in suitable soils, and constructed and operated properly. This guidance document is intended to help tribal nations determine what level of management or tribal regulation will work best to ensure public health and protect the environment.

What is onsite wastewater treatment?

Any sewage treatment process that removes contaminants from wastewater at or near the point of generation, with dispersal of fluid nearby, is considered "onsite", whether it serves a single-family residence, a restaurant, an office building or a major resort. The most common type of onsite wastewater treatment system is the septic system. Onsite wastewater treatment is also called decentralized wastewater treatment, to distinguish it from centralized treatment (at municipal sewage treatment plants.)

A typical septic system contains the two major components pictured at left: a water-tight septic tank and an absorption field, also known as a drain field or leachfield.

The purpose of the septic tank (see diagram below) is to separate solids from the liquid waste, and to promote breakdown of contaminants by microorganisms (bacteria) naturally present in wastewater. The wastewater breaks down into a layer of solids that sink, a liquid layer (which is mostly water) and a scum layer that floats. The septic tank slows and stabilizes the rate of flow to allow this decomposition. Septic tanks should be able to accommodate at least 2-3 days of average flow for adequate detention time. Solids and scum need to be removed by a professional septic tank pumper on a regular basis (approximately every 1 to 5 years, depending on the size of the tank and number of people using it). The liquid layer flows through the outlet of the septic tank to an absorption area.

As the liquid waste contacts air and microbes in the soil, treatment of pathogens can occur. Some of the liquid can evaporate, and some percolates down to the water table. In some areas where the depth to ground water is very great, seepage pits (which are sometimes mistaken for cesspools) are allowed to be used instead of a leachfield. In other areas where soils cannot provide adequate treatment, or do not drain at a rate that allows for treatment, additional treatment or dispersal technologies may be required. Many of these components, such as sand or peat filters, work by replacing what is missing from the soil environment.

Knowing the output of a conventional septic system in your local soils is the key to understanding how and if OWTS might pose a public health risk. The risk grows with the population. Increasing population density increases the contaminants, such as nitrogen, entering the environment through wastewater. What can a tribe do to manage these systems, while maximizing water use efficiency and ground water recharge, and minimizing risks to public health and the environment? The following pages provide an approach to this question.

Seabloom,2012-12-06 Following the end of World War II there was a major migration of population in the United States and Scandinavian countries to urban areas As a result of this migration and in part due to the public works moratoria imposed during the war a major program of sewer construction was instigated which resulted in the collection and subsequent concentration of large volumes of waste water at single discharge points As the assimilative capacity of these receiving waters was exceeded it led to or aggravated existing water pollution problems in these waters To mitigate this degradation of water quality a massive program to construct wastewater treatment facilities was instigated In addition large amounts of money were spent on research to improve the technology of the conventional collection and treatment concept In contrast the wastewater disposal problem of the rural home owner received little attention and in most cases the septic tank soil absorption system ST SAS was the interim solution In recent years there has been a fundamental change in the population growth pattern in the US and Scandinavian countries It appears that a great many people are moving back to rural areas where they seem to prefer the suburban or small town environment yet at the same time want all the conveniences of urban life The provision of proper wastewater disposal facilities presents a very perplexing problem because the capital and operating costs of conventional sewers are usually financially impractical for rural areas
