Design Examples for High Strength Steel Reinforced Concrete Columns Sing-Ping Chiew,Yanqing Cai,2018-04-17 This book is the companion volume to Design of High Strength Steel Reinforced Concrete Columns A Eurocode 4 Approach This book provides a large number of worked examples for the design of high strength steel reinforced concrete SRC columns It is based on the Eurocode 4 approach but goes beyond this to give much needed guidance on the narrower range of permitted concrete and steel material strengths in comparison to EC2 and EC3 and the better ductility and buckling resistance of SRC columns compared to steel or reinforced concrete Special considerations are given to resistance calculations that maximize the full strength of the materials with concrete cylinder strength up to 90 N mm² yield strength of structural steel up to 690 N mm² and yield strength of reinforcing steel up to 600 N mm² respectively These examples build on the design principles set out in the companion volume allowing the readers to practice and understand the EC4 methodology easily Structural engineers and designers who are familiar with basic EC4 design should find these design examples particularly helpful whilst engineering undergraduate and graduate students who are studying composite steel concrete design and construction should easily gain further understanding from working through the worked examples which are set out in a step by step clearly fashion

Slender Reinforced Concrete Columns Under Load and Moment David Schofield, 1983 Slender reinforced concrete columns have become widely used as structural members in recent years Current Codes of Practice for Structural Concrete lack sufficient guidance to designers for their safe and efficient design This investigation studies the behaviour of very slender pin ended reinforced concrete columns under short term and sustained loads by experiment and theoretical analysis A new approach is used in the method of applying load to the column A concentric axial load and independent primary end moments are considered This allows the determination of secondary moments due to axial force and secondary deflections to be easily determined compared with the conventional eccentric load methods adopted in the past A non linear second order computer analysis has been developed which is capable of accurately predicting the deflections of hinged columns throughout the loading range from zero load to buckling failure for any combination of eccentric loads and primary moments for short or sustained periods It has the potential to accept end restraint in order to model framed columns An extensive experimental programme of tests has been performed on 48 column specimens with slenderness ratios between 29 and 59 under short term loads and 5 specimens under sustained loads for up to two years A total of 68 short column specimens with an identical section to the slender columns and material specimens were also tested The specimens had a mean wet cured cube strength of 42 N sq mm The results of these tests and 120 similar results of other authors confirmed the validity of the proposed theoretical analysis and the assumptions used The computer program which is presented could be made available to design offices for use on a basic micro computer The design methods recommended by three Codes of Practice CP110 1972 ACI318 1977 and CP114 1957 have been compared with the experimental and theoretical results of this work CP110 and ACI318 are shown to give conservative designs with an overall load factor of 3.0 and 2.4 respectively for design loads compared with the 25 year load
