Geophysical Applications of Artificial Neural Networks and Fuzzy Logic W. Sandham, M. Leggett, 2013-06-29 The past fifteen years has witnessed an explosive growth in the fundamental

research and applications of artificial neural networks ANNs and fuzzy logic FL The main impetus behind this growth has been the ability of such methods to offer solutions not amenable to conventional techniques particularly in application domains involving pattern recognition prediction and control Although the origins of ANNs and FL may be traced back to the 1940s and 1960s respectively the most rapid progress has only been achieved in the last fifteen years This has been due to significant theoretical advances in our understanding of ANNs and FL complemented by major technological developments in high speed computing In geophysics ANNs and FL have enjoyed significant success and are now employed routinely in the following areas amongst others

Optimality in Biological and Artificial Networks? Daniel S. Levine, Wesley R. Elsberry, 2013-06-17 This book is the third in a series based on conferences sponsored by the Metroplex Institute for Neural Dynamics an interdisciplinary organization of neural network professionals in academia and industry The topics selected are of broad interest to both those interested in designing machines to perform intelligent functions and those interested in studying how these functions are actually performed by living organisms and generate discussion of basic and controversial

issues in the study of mind The topic of optimality was chosen because it has provoked considerable discussion and controversy in many different academic fields There are several aspects to the issue of optimality First is it true that actual behavior and cognitive functions of living animals including humans can be considered as optimal in some sense Second what is the utility function for biological organisms if any and can it be described mathematically Rather than organize the chapters on a biological versus artificial basis or by what stance they took on optimality it seemed more natural to organize them either by what level of questions they posed or by what intelligent functions they dealt with The book begins with some general frameworks for discussing optimality or the lack of it in biological or artificial systems The next set of chapters deals with some general mathematical and computational theories that help to clarify what the notion of optimality might entail in specific classes of networks The final section deals with optimality in the context of many different high level issues including exploring one's environment understanding mental illness linguistic communication and social organization The diversity of topics covered in this book is designed to stimulate interdisciplinary thinking and speculation about deep problems in intelligent system organization

Information Theory And Evolution (Third Edition) John Scales Avery, 2021-11-24 This highly interdisciplinary book discusses the phenomenon of life including its origin and evolution against the background of thermodynamics statistical mechanics and information theory Among the central themes is the seeming contradiction between the second law of thermodynamics and the high degree of order and complexity produced by living systems As the author shows this paradox has its resolution in the information content of the Gibbs free energy that enters the biosphere from outside sources Another focus of the book is the role of information in human cultural evolution which is also discussed with the origin of human linguistic abilities One of the final chapters addresses the merging of information technology and biotechnology into a new discipline bioinformation technology This third edition has been updated to reflect the latest scientific and technological advances Professor Avery makes use of the perspectives of famous scholars such as Professor Noam Chomsky and Nobel Laureates John O Keefe May Britt Moser and Edward Moser to cast light on the evolution of human languages The mechanism of cell differentiation and the rapid acceleration of information technology in the 21st century are also discussed With various research disciplines becoming increasingly interrelated today Information Theory and Evolution provides nuance to the conversation between bioinformatics information technology and pertinent social political issues This book is a welcome voice in working on the future challenges that humanity will face as a result of scientific and technological progress

Bayesian Field Theory Jörg C. Lemm, 2003-06-06 Ask a traditional mathematician the likely outcome of a coin toss and he will reply that no evidence exists on which to base such a prediction Ask a Bayesian and he will examine the coin conclude that it was probably not tampered with and predict five hundred heads in a thousand tosses a subsequent experiment would then be used to refine this prediction The Bayesian approach in other words permits the use of prior knowledge when testing a hypothesis Long the province of mathematicians and statisticians Bayesian methods are applied in this ground breaking book to problems in cutting edge physics Joerg Lemm offers practical examples of Bayesian analysis for the physicist working in such areas as neural networks artificial intelligence and inverse problems in quantum theory The book also includes nonparametric density estimation problems including as special cases nonparametric regression and pattern recognition Thought provoking and sure to be controversial Bayesian Field Theory will be of interest to physicists as well as to other specialists in the rapidly growing number of fields that make use of Bayesian methods Achim Weiguny Institut fuer Theoretische Physik

Knowledge-based Neurocomputing Ian Cloete, Jacek M. Zurada, 2000 Looking at ways to encode prior knowledge and to extract refine and revise knowledge within a neurocomputing system Neurocomputing methods are loosely based on a model of the brain as a network of simple interconnected processing elements corresponding to neurons These methods derive their power from the collective processing of artificial neurons the chief advantage being that such systems can learn and adapt to a changing environment In knowledge based neurocomputing the emphasis is on the use and representation of knowledge about an application Explicit modeling of the knowledge represented by such a system remains a major research topic The reason is that humans find it difficult to interpret the numeric representation of a neural network The key assumption of knowledge based neurocomputing is that knowledge is obtainable from or can be represented by a neurocomputing system in a form that humans can understand That is the knowledge embedded in the neurocomputing system can also be represented in a symbolic or well structured form such as Boolean functions automata rules or other familiar ways The focus of knowledge based computing is on methods to encode prior knowledge and to extract refine and revise knowledge within a neurocomputing system Contributors C Aldrich J Cervenka I Cloete R A Cozzio R Drossu J Fletcher C L Giles F S Gouws M Hilario M Ishikawa A Lozowski Z Obradovic C W Omlin M Riedmiller P Romero G P J Schmitz J Sima A Sperduti M Spott J Weisbrod J M Zurada

Neuromimetic Semantics Harry Howard, 2010-08-10 This book attempts to marry truth conditional semantics with cognitive linguistics in the church of computational neuroscience To this end it examines the truth conditional meanings of coordinators quantifiers and collective predicates as neurophysiological phenomena that are amenable to a neurocomputational analysis Drawing inspiration from work on visual processing and especially the simple complex cell distinction in early vision V1 we claim that a similar two layer architecture is sufficient to learn the truth conditional meanings of the logical coordinators and logical quantifiers As a prerequisite much discussion is given over to what a neurologically plausible representation of the meanings of these items would look like We eventually settle on a representation in terms of correlation so that for instance the semantic input to the universal operators e g and all is represented as maximally correlated while the semantic input to the universal negative operators e g nor no is represented as maximally anticorrelated On the basis this representation the hypothesis can be offered that the function of the logical operators is to extract an invariant feature from natural situations that of degree of correlation between parts of the situation This result sets up an elegant formal analogy to recent models of visual processing which argue that the function of early vision is to reduce the redundancy inherent in natural images Computational simulations are designed in which the logical operators are learned by associating their phonological form with some degree of correlation in the inputs so that the overall function of the system is as a simple kind of pattern recognition Several learning rules are assayed especially those of the Hebbian sort which are the ones with the most neurological support Learning vector quantization LVQ is shown to be a perspicuous and efficient means of learning the patterns that are of interest We draw a formal parallelism between the initial

competitive layer of LVQ and the simple cell layer in V1 and between the final linear layer of LVQ and the complex cell layer in V1 in that the initial layers are both selective while the final layers both generalize It is also shown how the representations argued for can be used to draw the traditionally recognized inferences arising from coordination and quantification and why the inference of subalternacy breaks down for collective predicates Finally the analogies between early vision and the logical operators allow us to advance the claim of cognitive linguistics that language is not processed by proprietary algorithms but rather by algorithms that are general to the entire brain Thus in the debate between objectivist and experiential metaphysics this book falls squarely into the camp of the latter Yet it does so by means of a rigorous formal mathematical and neurological exposition in contradiction of the experiential claim that formal analysis has no place in the understanding of cognition To make our own counter claim as explicit as possible we present a sketch of the LVQ structure in terms of mereotopology in which the initial layer of the network performs topological operations while the final layer performs mereological operations The book is meant to be self contained in the sense that it does not assume any prior knowledge of any of the many areas that are touched upon It therefore contains mini summaries of biological visual processing especially the retinocortical and ventral what parvocellular pathways computational models of neural signaling and in particular the reduction of the Hodgkin Huxley equations to the connectionist and integrate and fire neurons Hebbian learning rules and the elaboration of learning vector quantization the linguistic pathway in the left hemisphere memory and the hippocampus truth conditional vs image schematic semantics objectivist vs Computational Intelligence and Security Yunping Wang,Yiu-ming Cheung,Hailin Liu,2007-09-13 The refereed post proceedings of the International Conference on Computational Intelligence and Security are presented in this volume The 116 papers were submitted to two rounds of careful review Papers cover bio inspired computing evolutionary computation learning systems and multi agents cryptography information processing and intrusion detection systems and security image and signal processing and pattern recognition **Information Theory And Evolution (2nd Edition)** John Scales Avery,2012-05-21 Information Theory and Evolution discusses the phenomenon of life including its origin and evolution and also human cultural evolution against the background of thermodynamics statistical mechanics and information theory Among the central themes is the seeming contradiction between the second law of thermodynamics and the high degree of order and complexity produced by living systems This paradox has its resolution in the information content of the Gibbs free energy that enters the biosphere from outside sources as the author will show The role of information in human cultural evolution is another focus of the book The first edition of Information Theory and Evolution made a strong impact on thought in the field by bringing together results from many disciplines The new second edition offers updated results based on reports of important new research in several areas including exciting new studies of the human mitochondrial and Y chromosomal DNA Another extensive discussion featured in the second edition is contained in a new appendix devoted to the relationship of entropy and Gibbs free energy to

economics This appendix includes a review of the ideas of Alfred Lotka Frederick Soddy Nicholas Georgescu Roegen and Herman E Daly and discusses the relevance of these ideas to the current economic crisis The new edition discusses current research on the origin of life the distinction between thermodynamic information and cybernetic information new DNA research and human prehistory developments in current information technology and the relationship between entropy and economics
