Gupta, 2013-09-30 Satya P Gupta s Hydroxamics Acids is the first book to compile invited articles written by international experts on the class of compounds hydroxamic acids Found to possess a wide spectrum of biological activities the hydroxamic acids are of interest to theoretical and experimental chemists who can study and make use of them in drug design and development Chapters in this book provide a diverse and comprehensive coverage of this compound class and consequently this publication is a valuable resource for researchers in chemical pharmaceutical and biological sciences

Radiolabeled Matrix Metalloproteinase Inhibitors for Breast Cancer Therapy, 2002 Matrix Metalloproteinases MMPs a family of over 20 types of enzymes collectively are capable of degrading all the components of the extracellular matrix MMP 2 and MMP 9 also known as gelatinases are specifically thought to play critical roles in tumor cell invasion and are frequently co expressed in breast cancer Cyclic peptides containing the sequence HWGF have been described as selective inhibitors of MMP 2 and MMP 9 We tested the hypothesis that gelatinase expression may provide a

target for in vivo tumor imaging using a radiolabeled gelatinase inhibitor The peptide DOTA CTTHWGFTLC DOTA CTT was labeled with Cu 64 T 1 2 1 2% 12 7 h % which has a decay scheme suitable for both PET imaging and cancer therapy This conjugate maintained MMP 2 inhibitory activity comparable to %Ilomastat a broad range inhibitor of MMPs An increase in the MMP 2 9 activity of human metastatic breast cancer MDA MB 435 tumors in nude mice was observed from 4 to 10 weeks post implantation MicroPET images of Cu 64 DOTA CTT in the tumor bearing nude mice showed tumor uptake at 8 wk post implantation however the same mouse with 5 wk palpable tumors showed no uptake of the tracer suggesting that the MMP 2 and MMP 9 activity is related to the stage of tumor growth These data suggest the potential of radiolabeled gelatinase inhibitors as markers for imaging the metastatic capability of human breast cancer

EGFR Signaling Networks in Cancer Therapy John D. Haley, William John Gullick, 2009-03-01 The epidermal growth factor EGF receptor and its downstream signal transduction networks have been implicated in the ontology and maintenance of tumor tissues which has motivated the discovery and development of molecularly targeted anti EGF receptor therapies Over decades of study the EGF receptor structure its ligand binding domains the physical biochemistry underlying its intrinsic tyrosine kinase catalytic function and the modular interactions with SH2 PTB and SH3 domain containing signaling adaptor proteins required for signal transduction have been extensively dissected Not only is the EGF receptor the nexus of many streams of information but it also forms one part of a calculating device by forming dimers and oligomers with the other three receptors in its family in response to at least eleven ligands some of which are expressed in multiple forms with overlapping or quite distinct functions This phenomenon

while recruiting to the inner surface of the cell membrane and activating multiple second messenger proteins also allows the possibility of cross talk between these systems permitting a further layer of information to be exchanged Less well described are the cross regulation of the EGF receptor and other anti apoptotic mitogenic and metabolic signaling systems The study of these systems has yielded new surprises One hurdle in these efforts has been that signal transduction pathways have frequently been defined in the generic absence of their tissue specific or cell interaction specific context
