It provides a significant amount of the world's energy supply and it is the basis for many industries. However, in areas where coal lies close to the earth's surface and has been exploited by open cast techniques, radical alterations of landscape and significant impacts on the environment have occurred. This report was prepared to provide guidance to those who are responsible for the prevention of environmental effects from surface mining and for the restoration of the mining areas. Environmental problems of surface coal mining and restoration of the mine sites are discussed in the report. Particular attention is given to Eastern Europe which continues to be a major centre of opencast lignite mining. Reclamation of mined lands for forestry, agriculture and wildlife is briefly discussed. However, the sheer volume of coal removed from many mines in Eastern Europe is so vast that there is often insufficient overburden material to refill the pits. Consequently, the main focus of this report is on the creation of lakes in these former surface mines. Many problems have to be overcome in creating healthy lakes for recreation or wildlife. Guidelines for treating water quality problems and further development of lakes are provided. Techniques for dealing with acidic waters, eutrophication and contamination are discussed. **Costs of Strip Mine Reclamation in the West** Kenneth L.
