Neural Computation and Learning Vwani Roychowdhury,Kai-Yeung Siu,Alon Orlitsky,2012-12-06 For any research field to have a lasting impact there must be a firm theoretical foundation Neural networks research is no exception Some of the foundational concepts established several decades ago led to the early promise of developing machines exhibiting intelligence The motivation for studying such machines comes from the fact that the brain is far more efficient in visual processing and speech recognition than existing computers Undoubtedly neurological systems employ very different computational principles The study of artificial neural networks aims at understanding these computational principles and applying them in the solutions of engineering problems Due to the recent advances in both device technology and computational science we are currently witnessing an explosive growth in the studies of neural networks and their applications It may take many years before we have a complete understanding about the mechanisms of neural systems Before this ultimate goal can be achieved answers are needed to important fundamental questions such as a what can neural networks do that traditional computing techniques cannot b how does the complexity of the network for an application relate to the complexity of that problem and c how much training data are required for the resulting network to learn properly Everyone working in the field has attempted to answer these questions but general solutions remain elusive However encouraging progress in studying specific neural models has been made by researchers from various disciplines
