Mathodes Mathamatiques En Neutronique:

Méthodes mathématiques en neutronique Jacques Planchard, 1995 *Computational Methods in Transport* Frank Graziani, 2006-02-17 There exist a wide range of applications where a significant fraction of the momentum and energy present in a physical problem is carried by the transport of particles. Depending on the specific application the particles involved may be photons, neutrons, neutrinos or charged particles. Regardless of which phenomena is being described at the heart of each application is the fact that a Boltzmann-like transport equation has to be solved. The complexity and hence expense involved in solving the transport problem can be understood by realizing that the general solution to the 3D Boltzmann transport equation is in fact really seven dimensional: 3 spatial coordinates, 2 angles, 1 time and 1 for speed or energy. Low order approximations to the transport equation are frequently used due in part to physical justification but many in cases simply because a solution to the full transport problem is too computationally expensive. An example is the diffusion equation which effectively drops the two angles in phase space by assuming that a linear representation in angle is adequate. Another approximation is the grey approximation which drops the energy variable by averaging over it. If the grey approximation is applied to the diffusion equation the expense of solving what amounts to the simplest possible description of transport is roughly equal to the cost of implicit computational fluid dynamics. It is clear therefore that for those application areas needing some form of transport, fast, accurate and robust transport algorithms can lead to an increase in overall code performance and a decrease in time to solution.

The Physics of Nuclear Reactors Serge Marguet, 2018-02-26 This comprehensive volume offers readers a progressive and highly detailed introduction to the complex behavior of neutrons in general and in the context of nuclear power generation. A compendium and handbook for nuclear engineers, a source of teaching material for academic lecturers as well as a graduate text for advanced students and other non-experts wishing to enter this field, it is based on the author's teaching and research experience and his recognized expertise in nuclear safety. After recapping a number of points in nuclear physics, placing the theoretical notions in their historical context, the book successively reveals the latest quantitative theories concerning the slowing down of neutrons in matter, the charged particles and electromagnetic rays, the calculation scheme, especially the simplification hypothesis, the concept of criticality based on chain reactions, the theory of homogeneous and heterogeneous reactors, the problem of self-shielding, the theory of the nuclear reflector, a subject largely ignored in literature, the computational methods in transport and diffusion theories. Complemented by more than 400 bibliographical references, some of which are commented and annotated and augmented by an appendix on the history of reactor physics at EDF Electricité de France, this book is the most comprehensive and up-to-date introduction to and reference resource in neutronics and reactor theory.

Advanced Monte Carlo for Radiation Physics, Particle Transport Simulation and Applications Andreas Kling, Fernando J.C.
