Ruffed Grouse Life History Propagation M:

The North American Grouse: Their Biology and Behavior Paul Johnsgard, 2016 The ten currently recognized species of grouse in North America have played an important role in America's history from the famous but ill-fated heath hen a primary source of meat for the earliest New England immigrants to the ruffed grouse currently one of the most abundant and sought-after upland game birds in more than 40 states and provinces This book summarizes the ecology reproductive biology and social behavior of all ten of the extant North American grouse species It also describes the current status of grouse populations some of which are perilously close to extinction The social behavior of grouse is of special biological interest because among these ten species there is a complete mating system spectrum from seasonally monogamous pair bonding to highly promiscuous mating patterns The latter group illustrates the strong structural and behavioral effects of sexual selection resulting from nonmonogamous mating These influences reach a peak in the development by some grouse species of engaging in mating leks arena-like competitions performed by males while attempting to attract fertile females and also provide opportunities for females to select optimum mating partners These sexual competitions also promote strong differences evolving in sexual signaling behaviors displays among closely related species Nevertheless a relatively high incidence of mating errors and resulting hybridization often occurs in spite of these marked behavioral differences In addition to a text of 101 000 words the book includes 16 range maps 37 line drawings and 38 photographs by the author as well as nearly 1 400 literature citations

Ruffed Grouse Population Ecology in the Appalachian Region, 2007 S2 The Appalachian Cooperative Grouse Research Project ACGRP was a Multistate cooperative effort initiated in 1996 to investigate the apparent decline of ruffed grouse *Bonasa umbellus* and improve management throughout the central and southern Appalachian region i e parts of Ohio Pennsylvania Rhode Island Kentucky West Virginia Virginia and North Carolina USA Researchers have offered several hypotheses to explain the low abundance of ruffed grouse in the region including low availability of early successional forests due to changes in land use additive harvest mortality low productivity and recruitment and nutritional stress As part of the ACGRP we investigated ruffed grouse population ecology Our objectives were to estimate reproductive rates estimate survival and cause specific mortality rates examine if ruffed grouse harvest in the Appalachian region is compensatory and estimate ruffed grouse finite population growth We trapped 3 000 ruffed grouse in autumn Sep Nov and spring Feb Mar from 1996 to September 2002 on 12 study areas We determined the age and gender of each bird and fitted them with necklace style radiotransmitters and released them at the trap site We tracked ruffed grouse 2 times per week using handheld radiotelemetry equipment and gathered data on reproduction recruitment survival and mortality Ruffed grouse population dynamics in the Appalachian region differed from the central portion of the species range i e northern United States and Canada Ruffed grouse in the Appalachian region had lower productivity and recruitment but higher survival than reported for populations in the Great Lakes region and southern Canada Population dynamics differed between oak *Quercus* spp hickory *Carya* spp and mixed mesophytic forest associations within the southern and central Appalachian region Productivity and recruitment were lower in oak hickory forests but adult survival was higher than in mixed mesophytic forests Furthermore ruffed grouse productivity and recruitment were more strongly related to hard mast i e acorn production in oak hickory forests than in mixed mesophytic forests The leading cause of ruffed grouse mortality was avian predation 44% of known mortalities Harvest mortality accounted for 12% of all known mortalities and appeared to be compensatory Population models indicated ruffed grouse populations in the Appalachian region are declining $\lambda = 0.78 \pm 0.05$ but differences in model estimates highlighted the need for improved understanding of annual productivity and recruitment We posit ruffed grouse in the Appalachian region exhibit a clinal population structure characterized by changes in life history strategies Changes in life history strategies are in response to gradual changes in forest structure

quality of food resources snowfall and accumulation patterns and predator communities Management efforts should focus on creating a mosaic of forest stand ages across the landscape to intersperse habitat resources including nesting and brood cover adult escape cover roosting sites and most importantly food resources Land managers can intersperse habitat resources through a combination of clearcutting shelterwood harvest group selection and timber stand improvement including various thinnings and prescribed fire Managers should maintain current ruffed grouse harvest rates while providing high quality hunting opportunities We define high quality hunting as low hunting pressure low vehicle traffic and high flush rates Managers can provide high quality hunting opportunities through use of road closures in conjunction with habitat management S3 CRC Handbook of Avian Body Masses John B. Dunning, Jr.,1992-10-05 Body mass or weight is the most useful descriptive measure of relative body size in birds Masses are usually reported in avian studies of comparative ecology physiology breeding biology and zoology In addition adult body mass is a vital statistic for studies of allometric relationships growth and development flight and biometrics The data in this handbook was compiled to provide a ready reference source for body masses of most of the world s species of birds Masses of over 5 800 species are presented representing about 65% of the known birds Information for each species includes when available the mean standard deviation range sample size collecting locale and season and original source Separate means are presented for males and females in sexually dimorphic species This handbook should greatly improve the ability of avian researchers to quickly locate body masses for most bird species and incorporate this data into research Airplane design engineers and airport management professionals can also use these data to calculate the damage done by various species of birds when they hit aircraft Avid birders members of birding organizations and bird banders will also find the book useful for their activities

Wildlife Habitats in Managed Rangelands Chris Maser, 1984 *Analysis of Temperate Forest Ecosystems* D.E. Reichle, 2013-11-11 A series of concise books each by one or several authors will provide prompt world wide information on approaches to analyzing ecological systems and their interacting parts Syntheses of results in turn will illustrate the effectiveness and the limitations of current knowledge This series aims to help overcome the fragmentation of our understanding about natural and managed landscapes and water about man and the many other organisms which depend on these environments We may sometimes seem complacent that our environment has supported many civilizations fairly well better in some parts of the Earth than in others Modern technology has mastered some difficulties but creates new ones faster than we anticipate Pressures of human and other animal populations now highlight complex ecological problems of practical importance and theoretical scientific interest In every climatic biotic zone changes in plants soils waters air and other resources which support life are accelerating Such changes engulf not only regions already crowded or exploited They spill over into more natural areas where contrasting choices for future use should remain open to our descendants where Nature's own balances and imbalances can be interpreted by imaginative research and need to be
