**Organic Thin Film Transistor Integration** Flora Li, Arokia Nathan, Yiliang Wu, Beng S. Ong, 2011-03-21 Research on organic electronics or plastic electronics is driven by the need to create systems that are lightweight unbreakable and mechanically flexible With the remarkable improvement in the performance of organic semiconductor materials during the past few decades organic electronics appeal to innovative

practical and broad impact applications requiring large area coverage mechanical flexibility low temperature processing and low cost Thus organic electronics appeal to a broad range of electronic devices and products including transistors diodes sensors solar cells lighting displays and electronic identification and tracking devices A number of commercial opportunities have been identified for organic thin film transistors OTFTs ranging from flexible displays electronic paper radio frequency identification RFID tags smart cards to low cost disposable electronic products and more are continually being invented as the technology matures The potential applications for plastic electronics are huge but several technological hurdles must be overcome In many of these applications transistor serves as a fundamental building block to implement the necessary electronic functionality Hence research in organic thin film transistors OTFTs or organic field effect transistors OFETs is eminently pertinent to the development and realization of organic electronics This book presents a comprehensive investigation of the production and application of a variety of polymer based transistor devices and circuits It begins with a detailed overview of Organic Thin Film Transistors OTFTs and discusses the various possible fabrication methods reported so far This is followed by two major sections on the choice optimization and implementation of the gate dielectric material to be used Details of the effects of processing on the efficiency of the contacts are then provided The book concludes with a chapter on the integration of such devices to produce a variety of OTFT based circuits and systems The key objective is to examine strategies to exploit existing materials and techniques to advance OTFT technology in device performance device manufacture and device integration Finally the collective knowledge from these investigations facilitates the integration of OTFTs into organic circuits which is expected to contribute to the development of new generation of all organic displays for communication devices and other pertinent applications Overall a major outcome of this work is that it provides an economical means for organic transistor and circuit integration by enabling the use of a well established PECVD infrastructure while not compromising the performance of electronics The techniques established here are not limited to use in OTFTs only the organic semiconductor and SiNx combination can be used in other device structures e g sensors diodes photovoltaics Furthermore the approach and strategy used for interface optimization can be extended to the development of other materials systems

**Wireless Bioelectronic Devices Driven by Deep Red Light** Marie Jakešová, 2021-01-22 The use of electronic devices in medical care is one of the main targets of precision medicine The field of bioelectronic medicine uses electronic devices to diagnose or treat diseases and disorders in a complementary or alternative way to chemical drugs It has been more than sixty years since the world's first implantable battery driven cardiac pacemaker was implanted here in Sweden Since then electronic therapies have been implemented for neurological disorders such as Parkinson's disease epilepsy sensory and motor function restoration and many more However electronics can also be used for delivery of conventional drugs in a more controlled localized and specific fashion Therapeutic utility and patient comfort are maximized when the devices are as minimally invasive as possible The most important milestone in the development of the cardiac

stimulator was making it wireless The early versions of the device required bulky parts to be placed outside of the body with transcutaneous electrical leads to the target site which led to high infection risk and frequent failures To date batteries remain the most common way to power implantable electronics However their large size and the necessity for replacement surgeries makes the technology relatively invasive Alternative approaches to wireless power transfer are thus sought after The most promising technologies are based on electromagnetic ultrasound or light coupling methods The aim of this thesis is to utilize tissue penetrating deep red light for powering implantable devices The overarching concept is an organic photovoltaic based on small molecule donor acceptor bilayer junctions which allows for ultrathin flexible minimally invasive devices Within this thesis the photovoltaic device was utilized in two ways Firstly the photovoltaics are fabricated to act as an integrated driver for other implantable electronic components 1 an organic electronic ion pump for acetylcholine delivery 2 a depth probe microelectrode stimulation device for epilepsy applications Secondly an alternative device the organic electrolytic photocapacitor is formed by replacing one of the solid electrodes by an electrolytic contact thus yielding a minimalistic device acting as a direct photoelectrical stimulator Within the thesis the photocapacitive stimulation mechanism is validated by studying voltage gated ion channels in a frog oocyte model Next two lithography based patterning techniques are developed for fabricating these devices with better resolution and on flexible substrates suitable for in vivo operation Finally a chronic implant is demonstrated for in vivo sciatic nerve stimulation in rodents The end result of this thesis is a series of novel device concepts and methods for stimulation of the nervous system using deep red light
