Beers,2007 Applications of numerical mathematics and scientific computing to chemical engineering Tensor Numerical Methods in Quantum Chemistry Venera Khoromskaia,Boris N. Khoromskij,2018-06-11 The conventional numerical methods when applied to multidimensional problems suffer from the so called curse of dimensionality that cannot be eliminated by using parallel architectures and high performance computing The novel tensor numerical methods are based on a smart rank structured tensor representation of the multivariate functions and operators discretized on Cartesian grids thus reducing solution of the multidimensional integral differential equations to 1D calculations We explain basic tensor formats and algorithms and show how the orthogonal Tucker tensor decomposition originating from chemometrics made a revolution in numerical analysis relying on rigorous results from approximation theory Benefits of tensor approach are demonstrated in ab initio electronic structure calculations Computation of the 3D convolution integrals for functions with multiple singularities is replaced by a sequence of 1D operations thus enabling accurate MATLAB calculations on a laptop using 3D uniform tensor grids of the size up to 1015 Fast tensor based Hartree Fock solver incorporating the grid based low rank factorization of the two electron integrals serves as a prerequisite for economical calculation of the excitation energies of molecules Tensor approach suggests efficient grid based numerical treatment of the long range electrostatic potentials on large 3D finite lattices with

Molecular modelling in this context refers to modelling the structure, properties and reactions of atoms, molecules, materials. Each chapter is compiled by experts in their fields and provides a selective review of recent literature. With chemical modelling covering such a wide range of subjects, this Specialist Periodical Report serves as the first port of call to any chemist, biochemist, materials scientist or molecular physicist needing to acquaint themselves of major developments in the area. Specialist Periodical Reports provide systematic and detailed review coverage in major areas of chemical research. Compiled by teams of leading authorities in the relevant subject areas, the series creates a unique service for the active research chemist with regular in-depth accounts of progress in particular fields of chemistry. Subject coverage within different volumes of a given title is similar and publication is on an annual or biennial basis. Current subject areas covered are: Amino Acids, Peptides and Proteins, Carbohydrate Chemistry, Catalysis, Chemical Modelling Applications and Theory, Electron Paramagnetic Resonance, Nuclear Magnetic Resonance, Organometallic Chemistry, Organophosphorus Chemistry, Photochemistry and Spectroscopic Properties of Inorganic and Organometallic Compounds. From time to time the series has altered according to the fluctuating degrees of activity in the various fields but these volumes remain a superb reference point for researchers.
