

Light reactions: reactants and products

Here is an image of the light reactions in the thylakoid membrane. Drag the descriptions of events that occur during the light reactions to their correct location in the diagram.

The diagram illustrates the light reactions of photosynthesis in the thylakoid membrane. It features four main protein complexes: Photosystem II (PSII), the Cytochrome b6/f complex, Photosystem I (PSI), and ATP synthase. PSII is on the left, followed by the Cytochrome b6/f complex, then PSI, and finally ATP synthase on the right. Electrons flow from PSII through the Cytochrome b6/f complex to PSI. Protons are pumped from the stroma into the thylakoid space by both PSII and the Cytochrome b6/f complex. Light energy is captured at PSII and PSI, leading to the photolysis of water at PSII and the reduction of NADP+ at PSI. The resulting NADPH is then used in the Calvin cycle.

Light energy is captured at a peak wavelength of 680 nm.

Protons are pumped into the thylakoid space.

Light energy is captured at a peak wavelength of 700 nm.

Molecular oxygen is formed that will carry electrons to the carbon cycle.

Water is split to replace electrons lost from the reaction center.

ATP is made by chemiosmosis (proton gradient).

Protons are pumped into the thylakoid space.

ATP is made by chemiosmosis (proton gradient).

Reactions And Processes:

Chemical Reactions and Processes Under Flow Conditions Santiago V. Luis, Eduardo García-Verdugo, 2010

Pharmaceutical and fine chemical products are typically synthesised batchwise which is an anomaly since batch processes have a series of practical and economical disadvantages. On the contrary, flow continuous processes present a series of advantages leading to new ways to synthesise chemical products. Flow processes enable control reaction parameters more precisely: temperature, residence time, amount of reagents and solvent etc, leading to better reproducibility, safer and more reliable processes. They can be performed more advantageously using immobilized reagents or catalysts, improve the selectivity and productivity of the process and possibly even the stability of the catalyst. They offer opportunities for heat exchange and energy conservation as well as an easy separation and recycling of the reactants and products by adequate process design. They achieve multistep syntheses by assembling a line of reactors with minimum or no purification in between two reaction steps. They can be assured by facile automation, scale up can be easily conducted by number up. With all the new research activity in manufacturing chemical products, this comprehensive book is very timely as it summarises the latest trends in organic synthesis. It gives an insight into flow continuous processes, outlining the basic concepts and explaining the terminology of and systems approach to process design, dealing with both homogeneous and heterogeneous catalysis and mini or micro reactors. The book contains case studies, extensive bibliographies and reference lists in each chapter to enable the reader to grasp the contents and to go on to more detailed texts on specific subjects if desired. The book is written by both organic chemists and engineers, giving a multidisciplinary vision of the new tools and methodologies in this field. It is essential reading for organic chemists in industry or academia, working alongside chemical engineers or who want to undertake chemical engineering projects. It will also be of interest for chemical engineers to see how basic engineering concepts are applied in modern organic chemistry.

Derouane,Valentin Parmon,Francisco Lemos,Fernando Ramôa Ribeiro,2012-12-06 High throughput experimentation has met great success in drug design but it has so far been scarcely used in the field of catalysis We present in this book the outcome of a NATO ASI meeting that was held in Vilamoura Portugal between July 15 and 28 2001 with the objective of delineating and consolidating the principles and methods underpinning accelerated catalyst design evaluation and development There is a need to make the underlying principles of this new methodology more widely understood and to make it available in a coherent and integrated format The latter objective is particularly important to the young scientists who will constitute the new catalysis researchers generation Indeed this field which is at the frontier of fundamental science and may be a renaissance for catalysis is one which is much more complex than classical catalysis itself It implies a close collaboration between scientists from many disciplines chemistry physics chemical and mechanical engineering automation robotics and scientific computing in general In addition this emerging area of science is also of paramount industrial importance as progress in this area would collapse the time necessary to discover new catalysts or improve existing ones *Critique of Word Association Reactions* Arthur Howard Sutherland,1913
