

Reactivity of Solids

Solid state chemistry deals with the study of the synthesis, structure and physical properties of solid materials and continues to play an astounding role in many disciplines.

Solid state reactions may involve one or more of the following elementary (rate-limiting) steps:

- (i) Sorption phenomena (adsorption and desorption) of gaseous species on the solid surface;
- (ii) Chemical reaction on an atomic scale (homogeneous or interphase reactions);
- (iii) Nucleation of a new phase (in the bulk or at the surface of the reacting solid);
- (iv) Transport phenomena through solids (diffusion and migration).

Solid state reactions may be classified into four categories.

(a) Reactions of single solids

Colburn,1966 Proceedings of the Fifth International Conference on Erosion by Liquid and Solid Impact ,1979 **Laser-Induced Chemical Processes** Jeffrey I. Steinfeld,2012-12-06 The possibility of initiating chemical reactions by high intensity laser excitation has captured the imagination of chemists and physicists as well as of industrial scientists and the scientifically informed public in general ever since the laser first became available Initially great hopes were held that laser induced chemistry would revolutionize

synthetic chemistry making possible bond specific or mode specific reactions that were impossible to achieve under thermal equilibrium conditions. Indeed some of the early work in this area typically employing high power continuous wave sources was interpreted in just this way. With further investigation however a more conservative picture has emerged with the laser taking its place as one of a number of available methods for initiation of high energy chemical transformations. Unlike a number of these methods such as flash photolysis, shock tubes and electron beam radiolysis, the laser is capable of a high degree of spatial and molecular localization of deposited energy which in turn is reflected in such applications as isotope enrichment or localized surface treatments. The use of lasers to initiate chemical processes has led to the discovery of several distinctly new molecular phenomena, foremost among which is that of multiple photon excitation and dissociation of polyatomic molecules. This research area has received the greatest attention thus far and forms the focus of the present volume.
