Sumbatyan, 2017-03-28 This volume deals with topical problems concerning technology and design in construction of modern metamaterials The authors construct the models of mechanical electromechanical and acoustical behavior of the metamaterials which are founded upon mechanisms existing on micro level in interaction of elementary structures of the material The empiric observations on the phenomenological level are used to test the created models The book provides solutions based on fundamental methods and models using the theory of wave propagation nonlinear theories and composite mechanics for media with micro and nanostructure They include the models containing arrays of cracks defects with presence of micro and nanosize piezoelectric elements and coupled physical mechanical fields of different nature The investigations show that the analytical numerical and experimental methods permit evaluation of the qualitative and quantitative properties of the materials of this sort with diagnosis of their effective characteristics frequency intervals of effective energetic cutting and passing as well as effective regimes of damage evaluation by the acoustic methods

**Wave Dynamics, Mechanics and Physics of Microstructured Metamaterials** Mezhlum A. Sumbatyan, 2019-05-17 This book addresses theoretical and experimental methods for exploring microstructured metamaterials with a special focus on wave dynamics mechanics and related physical properties The authors use various mathematical and physical approaches to examine the mechanical properties inherent to particular types of metamaterials These include Boundary value problems in reduced strain gradient elasticity for composite fiber reinforced metamaterials Self organization of molecules in ferroelectric thin films Combined models for surface layers of nanostructures Computer simulation at the micro and nanoscale Surface effects with anisotropic properties and imperfect temperature contacts Inhomogeneous anisotropic metamaterials with uncoupled and coupled surfaces or interfaces Special interface finite elements and other numerical and analytical methods for composite structures      **Solid mechanics research for quantitative non-destructive evaluation** Jan D. Achenbach, Y. Rajapakse, 2012-12-06 Within the Solid Mechanics Program at the Office of Naval Research ONR our primary mission is to establish a basic research program which addresses the fundamental issues in solid mechanics where a clear scientific understanding is lacking Our approach involves first identifying the various scales at which material and structural response and failure occur Within each level of behavior we address the basic mechanical phenomena for which a clear physical description is not available ONR's program emphasizes experimental research to identify and quantify the interacting behavior and response mechanisms Theoretical and computational approaches are developed to explain the

details of the physical processes and to establish the technology necessary to control the thermomechanical behavior of materials and structures Within the Department of Defense it is a natural evolution that all new systems must generally operate in more demanding environments than the systems they replace Thus structural designers are pushed towards lighter weight precision structures utilizing new materials In such an environment structural design margins simultaneously shrink and become more critical Such trends make it essential that a well founded scientific base for the nondestructive detection and assessment of subcritical flaws in structural materials and structures exist Within the ONR Solid Mechanics Program we are interested in both the identification of flaws and assessment of their degree of criticality

[The Evaluation of Materials and Structures by Quantitative Ultrasonics](#) J.D. Achenbach, 2014-05-04 Nondestructive evaluation NDE procedures are needed for materials processing as well as for post process materials testing They play important roles in product design analysis of service life expectancy manufacturing and quality control of manufactured products They are also essential to on line monitoring of the integrity of structural elements and complex systems Rational accept and reject criteria should be based on NDE tests Critical safety efficiency and operational features of large scale structures depend on adequate NDE capabilities The lectures presented in this volume are concerned with quantitative ultrasonic NDE They present fundamental concepts and basic theory as well as applications to the detection of cracks and the evaluation of material properties The following topics are discussed basic wave propagation theory for ultrasonic NDE piezoelectric transducers EMATS and ultrasonic spectroscopy laser based ultrasonics acoustoelasticity
