Zohdi, 2012-04-09 Recently several applications

primarily driven by microtechnology have emerged where the use of materials with tailored electromagnetic dielectric properties are necessary for a successful overall design The tailored aggregate properties are achieved by combining an easily moldable base matrix with particles having dielectric properties that are chosen to deliver desired effective properties In many cases the analysis of such materials requires the simulation of the macroscopic and microscopic electromagnetic response as well as its resulting coupled thermal response which can be important to determine possible failures in hot spots This necessitates a stress analysis Furthermore because oftentimes such processes initiate degradatory chemical processes it can be necessary to also include models for these processes as well A central objective of this work is to provide basic models and numerical solution strategies to analyze the coupled response of such materials by direct simulation using standard laptop/desktop equipment Accordingly this monograph covers 1 The foundations of Maxwell's equations 2 Basic homogenization theory 3 Coupled systems electromagnetic thermal mechanical and chemical 4 Numerical methods and 5 An introduction to select biological problems The text can be viewed as a research monograph suitable for use in an upper division undergraduate or first year graduate course geared towards students in the applied sciences mechanics and mathematics that have an interest in the analysis of particulate materials **Cumulated Index to the Books**, 1933
