REACTION KINETICS

MAKING CHEMICAL REACTIONS HAPPEN FASTER

There are a number of different things that we can change to make a chemical reaction faster. Here, we explain the concept of collision theory, and how it can be used to explain the effects of five different factors on the rate of a chemical reaction.
COLLISION THEORY

NO REACTION   NO REACTION

Collision theory states that, for a reaction to occur, particles must collide with the correct orientation and with sufficient energy for a reaction to occur. Different factors affect the rate of the reaction by affecting the frequency of particle collisions, and/or the proportion of collisions that have enough energy to react.
INCREASE CONCENTRATION OF REACTANTS

FREQUENCY OF COLLISIONS   % SUCCESSFUL COLLISIONS

Increasing the concentration of reactants in solution increases the rate of reaction as there are a greater number of particles available to react. This increases the frequency of collisions between particles.

### INCREASE TEMPERATURE OF REACTION

FREQUENCY OF COLLISIONS   % SUCCESSFUL COLLISIONS

Increasing the temperature increases the kinetic energy of particles. This increases the frequency of particle collisions, and a greater proportion of collisions will have the energy required to react.
INCREASE SURFACE AREA OF REACTANTS

INCREASE PRESSURE OF REACTION

USE A CATALYST IN THE REACTION
