Neuropsychological Interpretations Of Objective Psychological Tests:

Neuropsychological Interpretation of Objective Psychological Tests Charles J. Golden, Patricia Espe-Pfeifer, Jana Wachsler-Felder, 2006-04-11 The inter comparison of specific skills as represented by performance on neuropsychological tests is at the heart of the neuropsychological assessment process. However, there is a tendency to regard the interpretation of single tests as a process that is independent of performance on other tests with integration of test information representing a summary of these individual test performances. As neuropsychology has become increasingly sophisticated, it has been recognized that many factors influence the performance on any given test. The meaning of the same score may vary considerably from one person to another depending on his or her performance on other neuropsychological tests. Thus a low score on the Halstead Category Test may indeed reflect frontal lobe damage but only if we first rule out the influence of visual spatial problems, emotionality, attentional issues, motivation, fatigue, and comprehension of the instructions. Simplistic interpretations that assume a common interpretation based on a specific score will inevitably lead to errors in interpretation and conclusions. The purpose of this book is to provide each test that is described with a compendium of the possible interpretations that can be used with a variety of common tests that are often included in a neuropsychological test battery. The first chapter discusses some of the pitfalls and cautions when comparing the tests while the second chapter examines administrative and scoring issues that may be unclear or unavailable for a given test.

Practitioner's Guide to Evaluating Change with Intellectual Assessment Instruments Robert J. McCaffrey, Holly James Westervelt, 2013-03-14 While conducting research on intellectual and neuropsychological performance of various patient populations across time, we became aware of the lack of information concerning practice effects associated with many widely used assessment instruments. Although test retest data were available for almost all of these instruments, it typically came in the form of correlation coefficients and mean changes in performance between assessments was often absent. In a 1995 article, McCaffrey and Westervelt (1995) discussed a number of issues relevant to serial neuropsychological and intellectual assessment and concluded that clinical neuropsychological practitioners had few guidelines to assist them in interpreting change in a patient's performance across assessments. This volume represents our efforts at reviewing the literature between 1970 and 1998 and extracting the reported information on practice effects. The tables include the assessment instrument used, information on the subject, patient groups, the sample size, gender, age, intervention interval between the assessments, scores at both assessment points, and the citation. The tables reflect the existing published literature within intellectual assessment and therefore some instruments, e.g., Wechsler tests, comprise a majority of the tables, whereas others, e.g., Raven's Progressive Matrices, Stanford-Binet, do not. The test index is arranged by the name of the test as reported in the specific article. We caution readers to refer to the original articles if
