Radiation Effects In Advanced Semiconductor Materials And Devices:

Radiation Effects in Advanced Semiconductor Materials and Devices C. Claeys, E. Simoen, 2013-11-11 In the modern semiconductor industry there is a growing need to understand and combat potential radiation damage problems. Space applications are an obvious case but beyond that today's device and circuit fabrication rely on increasing numbers of processing steps that involve an aggressive environment where inadvertent radiation damage can occur. This book is both aimed at post graduate researchers seeking an overview of the field and will also be immensely useful for nuclear and space engineers and even process engineers. A background knowledge of semiconductor and device physics is assumed but the basic concepts are all briefly summarized. Finally the book outlines the shortcomings of present experimental and modeling techniques and gives an outlook on future developments.

Radiation Effects in Silicon Carbide A.A. Lebedev, 2017 The book reviews the most interesting research concerning the radiation defects formed in 6H 4H and 3C SiC under irradiation with electrons, neutrons and some kinds of ions. The electrical parameters that make SiC a promising material for applications in modern electronics are discussed in detail. Specific features of the crystal structure of SiC are considered. It is shown that when wide bandgap semiconductors are studied it is necessary to take into account the temperature dependence of the carrier removal rate which is a standard parameter for determining the radiation hardness of semiconductors. The carrier removal rate values obtained by irradiation of various SiC polytypes with n and p type conductivity are analyzed in relation to the type and energy of the irradiating particles. The influence exerted by the energy of charged particles on how radiation defects are formed and conductivity is compensated in semiconductors under irradiation is analyzed. Furthermore the possibility to produce controlled transformation of silicon carbide polytype is considered. The involvement of radiation defects in radiative and nonradiative recombination processes in SiC is analyzed. Data are also presented regarding the degradation of particular SiC electronic devices under the influence of radiation and a conclusion is made regarding the radiation resistance of SiC. Lastly the radiation hardness of devices based on silicon and silicon carbide are compared.

Research on the Radiation Effects and Compact Model of SiGe HBT Yabin Sun, 2017-10-24 This book primarily focuses on the radiation effects and compact model of silicon germanium SiGe heterojunction bipolar transistors HBTs. It introduces the small signal equivalent circuit of SiGe HBTs including the distributed effects and proposes a novel direct analytical extraction technique based on non linear rational function fitting. It also presents the total dose effects irradiated by gamma rays and heavy ions as well as the single event transient induced by pulse laser microbeams. It offers readers essential information on the irradiation effects technique and the SiGe HBTs model using that technique.
