Radiation Hydrodynamics J. I. Castor, 2003 The discipline of radiation hydrodynamics is the branch of hydrodynamics in which the moving fluid absorbs and emits electromagnetic radiation and in so doing modifies its dynamical behavior That is the net gain or loss of energy by parcels of the fluid material through absorption or emission of radiation are sufficient to change the pressure of the material and therefore change its motion alternatively the net momentum exchange between radiation and matter may alter the motion of the matter directly Ignoring the radiation contributions to energy and momentum will give a wrong prediction of the hydrodynamic motion when the correct description is radiation hydrodynamics Of course there are circumstances when a large quantity of radiation is present yet can be ignored without causing the model to be in error This happens when radiation from an exterior source streams through the problem but the latter is so transparent that the energy and momentum coupling is negligible Everything we say about radiation hydrodynamics applies equally well to neutrinos and photons apart from the Einstein relations specific to bosons but in almost every area of astrophysics neutrino hydrodynamics is ignored simply because the systems are exceedingly transparent to neutrinos even though the energy flux in neutrinos may be substantial Another place where we can do radiation hydrodynamics without using any sophisticated theory is deep within stars or other bodies where the material is so opaque to the radiation that the mean free path of photons is entirely negligible compared with the size of the system the distance over which any fluid quantity varies and so on In this case we can suppose that the radiation is in equilibrium with the matter locally and its energy pressure and momentum can be lumped in with those of the rest of the fluid That is it is no more necessary to distinguish photons from atoms nuclei and electrons than it is to distinguish hydrogen atoms from helium atoms for instance There are all just components of a mixed fluid in this case So why do we have a special subject called radiation hydrodynamics when photons are just one of the many kinds of particles that comprise our fluid The reason is that photons couple rather weakly to the atoms ions and electrons much more weakly than those particles couple with each other Nor is the matter radiation coupling negligible in many problems since the star or nebula may be millions of mean free paths in extent Radiation hydrodynamics exists as a discipline to treat those problems for which the energy and momentum coupling terms between matter and radiation are important and for which since the photon mean free path is neither extremely large nor extremely small compared with the size of the system the radiation field is not very easy to calculate In the theoretical development of this subject many of the relations are presented in a form that is described as approximate and perhaps accurate only to order of νc This makes the discussion cumbersome Why are we

required to do this It is because we are using Newtonian mechanics to treat our fluid yet its photon component is intrinsically relativistic the particles travel at the speed of light There is a perfectly consistent relativistic kinetic theory and a corresponding relativistic theory of fluid mechanics which is perfectly suited to describing the photon gas But it is cumbersome to use this for the fluid in general and we prefer to avoid it for cases in which the flow velocity satisfies $u \ll c$ The price we pay is to spend extra effort making sure that the source sink terms relating to our relativistic gas component are included in the equations of motion in a form that preserves overall conservation of energy and momentum something that would be automatic if the relativistic equations were used throughout

Radiation Hydrodynamics John I. Castor, 2004 This broad and up to date treatment provides an accessible introduction to the theory and the large scale simulation methods currently used in radiation hydrodynamics A valuable text for research scientists and graduate students in physics and astrophysics

Relativistic Hydrodynamics Luciano Rezzolla, Olindo Zanotti, 2013-09-26 This book provides an up to date lively and approachable introduction to the mathematical formalism numerical techniques and applications of relativistic hydrodynamics The topic is presented here in a form which will be appreciated both by students and researchers in the field

Computational Methods in Transport Frank Graziani, 2006-02-17

There exist a wide range of applications where a significant fraction of the momentum and energy present in a physical problem is carried by the transport of particles Depending on the specific application the particles involved may be photons neutrons neutrinos or charged particles Regardless of which phenomena is being described at the heart of each application is the fact that a Boltzmann like transport equation has to be solved The complexity and hence expense involved in solving the transport problem can be understood by realizing that the general solution to the 3D Boltzmann transport equation is in fact really seven dimensional 3 spatial coordinates 2 angles 1 time and 1 for speed or energy Low order approximations to the transport equation are frequently used due in part to physical justification but many in cases simply because a solution to the full transport problem is too computationally expensive An example is the diffusion equation which effectively drops the two angles in phase space by assuming that a linear representation in angle is adequate Another approximation is the grey approximation which drops the energy variable by averaging over it If the grey approximation is applied to the diffusion equation the expense of solving what amounts to the simplest possible description of transport is roughly equal to the cost of implicit computational fluid dynamics It is clear therefore that for those application areas needing some form of transport fast accurate and robust transport algorithms can lead to an increase in overall code performance and a decrease in time to solution

Computational Methods for Astrophysical Fluid Flow Randall J. LeVeque, Dimitri Mihalas, E.A. Dorfi, Ewald Müller, 2006-04-18 This book leads directly to the most modern numerical techniques for compressible fluid flow with special consideration given to astrophysical applications Emphasis is put on high resolution shock capturing finite volume schemes

based on Riemann solvers The applications of such schemes in particular the PPM method are given and include large scale simulations of supernova explosions by core collapse and thermonuclear burning and astrophysical jets Parts two and three treat radiation hydrodynamics The power of adaptive moving grids is demonstrated with a number of stellar physical simulations showing very crispy shock front structures High-Energy-Density Physics R Paul Drake,2018-01-02 The raw numbers of high energy density physics are amazing shock waves at hundreds of km s approaching a million km per hour temperatures of millions of degrees and pressures that exceed 100 million atmospheres This title surveys the production of high energy density conditions the fundamental plasma and hydrodynamic models that can describe them and the problem of scaling from the laboratory to the cosmos Connections to astrophysics are discussed throughout The book is intended to support coursework in high energy density physics to meet the needs of new researchers in this field and also to serve as a useful reference on the fundamentals Specifically the book has been designed to enable academics in physics astrophysics applied physics and engineering departments to provide in a single course an introduction to fluid mechanics and radiative transfer with dramatic applications in the field of high energy density systems This second edition includes pedagogic improvements to the presentation throughout and additional material on equations of state heat waves and ionization fronts as well as problem sets accompanied by solutions High Energy Density Laboratory Astrophysics Sergey V.

Lebedev,2007-05-27 During the past decade research teams around the world have developed astrophysics relevant research utilizing high energy density facilities such as intense lasers and z pinches Every two years at the International conference on High Energy Density Laboratory Astrophysics scientists interested in this emerging field discuss the progress in topics covering Stellar evolution stellar envelopes opacities radiation transport Planetary Interiors high pressure EOS dense plasma atomic physics Supernovae gamma ray bursts exploding systems strong shocks turbulent mixing Supernova remnants shock processing radiative shocks Astrophysical jets high Mach number flows magnetized radiative jets magnetic reconnection Compact object accretion disks x ray photoionized plasmas Ultrastrong fields particle acceleration collisionless shocks These proceedings cover many of the invited and contributed papers presented at the 6th International Conference on High Energy Density Laboratory Astrophysics which was held on March 11 14 2006 at Rice University in Houston Texas USA

Foundations of High-Energy-Density Physics Jon Larsen,2017-03-10 High energy density physics explores the dynamics of matter at extreme conditions This encompasses temperatures and densities far greater than we experience on Earth It applies to normal stars exploding stars active galaxies and planetary interiors High energy density matter is found on Earth in the explosion of nuclear weapons and in laboratories with high powered lasers or pulsed power machines The physics explored in this book is the basis for large scale simulation codes needed to interpret experimental results whether from astrophysical observations or laboratory scale experiments The key elements of high energy density physics covered are gas dynamics ionization thermal energy transport and radiation transfer intense electromagnetic waves and their dynamical
