Current Catalog National Library of Medicine (U.S.), 1980 First multi year cumulation covers six years 1965-70 **Oh Omnivore! The Path Of An Eclectic Theoretical Biologist** Richard Gordon, 2025-04-02 Richard Gordon is a theoretical biologist who has led a multifaceted career with research spanning various fields and being a professor in departments as varied as Radiology and Botany. His eclectic scientific pursuits and prolific writing have resulted in over 200 peer reviewed publications as well as many edited books and special issues. This is his personal memoir. It is based on a review of all his publications from Gordon's early years to the present. He recounts the collaborations most importantly including the development of the nonlinear Algebraic Reconstruction Technique for image reconstruction, his most cited work. The ART algorithm today forms the basis of technologies that have dramatically improved progress from both basic science and in medicine such as computed tomography to 3D imaging of the sun's corona from satellites launched around the sun. The memoir offers a unique blend of scientific storytelling, personal reflection, and humanitarian endeavor, providing a fascinating glimpse into the life and work of a theoretical biologist with a remarkable range of interests and accomplishments. The overarching theme is how does one survive as a generalist in an academic world of specialists. The key seems to have been to have many collaborators both in and outside the academic world and diverse grant sources. The result has been an enjoyable and highly productive career exploring many aspects of the world from amusing games to profound scientific and philosophical questions to potentially significant contributions to humanity. By following his interests, Gordon shows it is still possible to be a polymath in a fractionated world. Along the way, the author suggests many outstanding problems he's encountered that readers may want to tackle themselves. **Questions of Uniqueness and Resolution in**

Reconstruction from Projections M. B. Katz, 2013-03-13 Reconstruction from projections has revolutionized radiology and has now become one of the most important tools of medical diagnosis. The EMI Scanner is one example. In this text, some fundamental theoretical and practical questions are resolved. Despite recent research activity in the area, the crucial subject of the uniqueness of the reconstruction and the effect of noise in the data posed some unsettled fundamental questions. In particular, Kennan Smith proved that if we describe an object by a C^∞ function, i.e., infinitely differentiable with compact support, then there are other objects with the same shape, i.e., support, which can differ almost arbitrarily and still have the same projections in finitely many directions. On the other hand, he proved that objects in finite dimensional function spaces are uniquely determined by a single projection for almost all angles, i.e., except on a set of measure zero. Along these lines, Herman and Rowland in "Three Methods for reconstructing objects from x-rays: a comparative study" (1973) showed that reconstructions obtained from the commonly used algorithms can grossly misrepresent the object and that the algorithm

which produced the best reconstruction when using noiseless data gave unsatisfactory results with noisy data Equally important are reports in Science and personal communications by radiologists indicating that in medical practice failure rates of reconstruction vary from four to twenty percent within this work the mathematical dilemma posed by Kennan Smith's result is discussed and clarified **Information Processing in Medical Imaging** Frank Deconinck, 2012-12-06

Proceedings of the 8th Conference Brussels 29 August 2 September 1983 *Proceedings of the 3rd International Symposium on Orbital Disorders Amsterdam, September 5-7, 1977* G.M. Bleeker, 2012-12-06 We have compiled a series of over 300 consecutive cases of unilateral exophthalmos with definitive diagnosis of the causes of disease process and an adequate follow up period Orbital and periorbital tumors constitute 34% of this series inflammatory diseases including thyroid disorders 50% arteriovenous abnormalities 4% and miscellaneous disorders 12% All patients were thoroughly evaluated clinically and with appropriate diagnostic tests including ultrasonography combined A scan and B scan computerized axial tomography EMI cranial scan and radiographic techniques plain films and hypocyclusal polytomography orbital venography and carotid arteriography Each test was found to have diagnostic capabilities which complemented other studies depending upon the specific disease process involved No one test was entirely adequate without the others Radiographic studies demonstrated bony abnormality in 50% of tumor cases but in only 28% of the entire series of exophthalmos cases Primary orbital tumors had a lower yield with radiography than did secondary tumors Computerized tomography demonstrated diagnostic soft tissue abnormality in 86% of tumors 43% of inflammatory diseases and an overall yield of 62% positive results Ultrasonography proved the most versatile test for evaluation of orbital soft tissues with 80% positive results for tumors 87% for inflammatory disorders and 78% overall accurate diagnosis **Inverse Scattering Problems in Optics** H.P. Baltes, 2012-12-06 When in the spring of 1979 H P Baltes presented me with the precursor of this volume the book on Inverse Source Problems in Optics I expressed my gratitude in a short note which in translation reads Dear Dr Baltes the mere title of your unexpected gift evokes memories of a period which in the terminology of your own contribution would be described as the Stone Age of the Inverse Problem Those were pleasant times Walter Kohn and I lived in a cave by ourselves drew pictures on the walls and nobody seemed to care Now however Inversion has become an Industry which I contemplate with as much bewilderment as a surviving Tasmanian aborigine gazing at a modern oil refinery with its towers its flames and the confusing maze of its tubes The present volume makes me feel even more aboriginal impossible for me to fathom its content What I can point out however is one of the forgotten origins of the Inverse Scattering Problem of Quantum Mechanics Werner Heisenberg's S Matrix Theory of 1943 This grandiose scheme had the purpose of eliminating the notion of the Hamiltonian in favour of the scattering operator If Successful it would have done away once and for all with any kind of inverse problem **Roentgen-video-techniques for Dynamic Studies of Structure and Function of the Heart and Circulation** Lars Björk, 1978 **Total Body Computerized Tomography** N.
