Compound Semiconductors Mark Alan Dodd, 1994 Data are presented on various infrared detectors based on multiple GaAs AlGaAs quantum wells Due to the great flexibility in the growth dimensions and composition of these structures the electrical and optical characteristics of the photodetector may be significantly altered This investigation explores both theoretically and experimentally the effect of modifying the well and barrier parameters As GaAs AlGaAs based materials are prevalent in optical generation devices such as LEDs and lasers it is natural to explore these materials use for optical receivers as well While most LEDs and lasers operate in the visible and near infrared less than one micrometer structures can operate to detect radiation with longer wavelengths The simplest method to achieve longer wavelength absorption is through the use of quantum mechanical wells and their associated bound energy states The energy level of the bound state may be changed by altering the well width or barrier composition This allows one to tune the spectral response of the photodetector for a given application Three fundamental classes of quantum well infrared detectors QWIDs are examined Each of these n type well doped structures has its merits and drawbacks The bound to bound state energy class is shown to have low dark current but also low responsivity The bound to continuum class results in high dark current high responsivity detectors The bound to miniband QWIDs have low dark currents and moderate responsivity All three classes are explored in greater detail in an effort to increase responsivity This was accomplished by altering the doping profile of the fundamental structure to include doping of the barrier The results indicate that a factor of six increase is possible for the bound to continuum structure An increase in operating temperature is an additional benefit of the revised doping profile As QWIDs do not typically respond to normally incident radiation an optical grating must be used to couple the radiation so that it may be absorbed A variety of one and two dimensional gratings are studied and their impact on performance is reported The fabrication technique used to form the grating is also examined A deposited metal grating with a thin gold overcoat was found to yield the most efficient coupling and therefore the highest responsivity
