Obesity and Cardiovascular Disease
Gianluca Iacobellis, 2009-10-08 The number of individuals who are obese or overweight has dramatically increased over

recent years and is now becoming epidemic These individuals are more likely to suffer cardiovascular diseases and therefore physicians specialists and trainees increasingly need to deal with these issues on the ward and in clinic As a result the need for appropriate knowledge of up to date clinical management of obesity and its associated cardiovascular problems is essential for any practising physician Obesity and Cardiovascular Disease is a readily assimilated pocket guide to obesity and cardiovascular disease It is intended to be used on the go and is compact enough to be on hand whilst in consultation with patients It provides a clear and succinct overview of contemporary clinical management of cardiovascular risk stratification and fully covers the diagnosis and treatment of cardiovascular in obese patients and individuals with increased visceral adiposity translating up to date clinical research findings into clinical practice Particular emphasis is placed on recent updates in practical care in obesity and cardiovascular disease such as new diagnostic techniques and novel pharmacological and surgical approaches as well as cardiac visceral fat ethnic differences in adiposity related cardiovascular risk and metabolically healthy but obese subjects Topics are presented in an easily accessible format with numerous illustrations photographs tables diagnostic and therapeutic algorithms while highlight boxes summarise the main concepts discussed in each chapter

COVID-19's Consequences on the Cardiovascular System Fabian Sanchis-Gomar,Amer Harky,2024-04-04 COVID 19 Consequences on Cardiovascular System Immediate Intermediate and Long Term Complications covers all the aspects related with the interplay between SARS COV 2 infection and the cardiovascular system from bench to bedside and from acute infection to long term complications Written by a team of experts this book is a one stop shop reference for both healthcare professionals and researchers who require a comprehensive view into the deleterious effects of COVID 19 on the cardiovascular system the relationship of cardiovascular risk factors with COVID 19 prognosis and further insights on the biomarkers that currently make it possible to predict and monitor the evolution of the disease at the cardiovascular level Scientific evidence demonstrates that while COVID 19 primarily affects the lungs it also affects multiple organs particularly the cardiovascular system with its most common complications being arrhythmia cardiac injury fulminant myocarditis heart failure and pulmonary embolism Covers all the current scientific pieces of evidence about the effects of COVID 19 on the heart and cardiovascular system from both a basic and a clinical point of view Discusses immediate intermediate and long term complications of COVID 19 on the cardiovascular system Includes studies conducted worldwide by well known experts in related fields

Patient-Specific Modeling of the Cardiovascular System Roy C.P. Kerckhoffs,2010-09-03 Peter Hunter Computational physiology for the cardiovascular system is entering a new and exciting phase of clinical application Biophysically based models of the human heart and circulation based on patient specific anatomy but also informed by population atlases and incorporating a great deal of mechanistic understanding at the cell tissue and organ levels offer the prospect of evidence based diagnosis and treatment of cardiovascular disease The clinical value of patient specific modeling is well illustrated in application areas where model based interpretation of clinical images allows a more precise analysis of

disease processes than can otherwise be achieved For example Chap 6 in this volume by Speelman et al deals with the very difficult problem of trying to predict whether and when an abdominal aortic aneurysm might burst This requires automated segmentation of the vascular geometry from magnetic resonance images and finite element analysis of wall stress using large deformation elasticity theory applied to the geometric model created from the segmentation The time varying normal and shear stress acting on the arterial wall is estimated from the arterial pressure and flow distributions Thrombus formation is identified as a potentially important contributor to changed material properties of the arterial wall Understanding how the wall adapts and remodels its material properties in the face of changes in both the stress loading and blood constituents associated with inflammatory processes IL6 CRP MMPs etc
