Cortico-Subcortical Dynamics in Parkinson's Disease Kuei-Yuan Tseng,2009-04-20 The striatum is the principal input structure of the basal ganglia Numerically the great majority of neurons in the striatum are spiny projection neurons which produce the inhibitory output of the striatum to the globus pallidum and substantia nigra The major glutamatergic afferents to the striatum from the cerebral cortex make monosynaptic contact with spiny projection neurons The dopaminergic afferents from the substantia nigra also synapse directly on the spiny projection neurons Thus the spiny projection neurons play a crucial role in the input output operations of the striatum by integrating glutamatergic cortical inputs with dopaminergic inputs and producing the output to other basal ganglia nuclei Anatomical observations made nearly 30 years ago suggested that inhibitory interactions among the spiny projection neurons of the striatum are very pr able Individual spiny projection neurons produce a local axonal plexus in the spheroidal space occupied by their own dendritic trees 1 2 Based on the GABAergic nature of these neurons and their synaptic contacts with other spiny neurons several authors have proposed that the spiny projection neurons form a lateral inhibition type of neural network 3 5 In the idealised concept of lateral inhibition each output neuron makes inhibitory synaptic contact with its neighbours 5 However there are physical limitations set by the extent of axonal and dendritic trees and the number of synaptic sites which mean that lateral inhibition is limited to a local domain of inhibition

Cell Therapy, Stem Cells and Brain Repair Cyndy D. Davis,Paul R.

Sanberg,2007-11-09 As our world continues to evolve the field of regenerative medicine flows suit Although many modern day therapies focus on synthetic and natural medicinal treatments for brain repair many of these treatments and prescriptions lack adequate results or only have the ability to slow the progression of neurological disease or injury Cell therapy however remains the most compelling treatment for neurodegenerative diseases disorders and injuries including Parkinson's disease Huntington's disease traumatic brain injury and stroke which is expanded upon in more detail in Chapter 1 by Snyder and colleagues Cell therapy is also unique in that it is the only therapeutic strategy that strives to replace lost damaged or dysfunctional cells with healthy ones This repair and replacement may be due to an administration of exogenous cells itself or the activation of the body's own endogenous reparative cells by a trophic immune or inflammatory response to cell transplantation However the precise mechanism of how cell therapy works remains elusive and is continuing to be investigated in terms of molecular and cellular responses in particular Moreover Chapter 11 by Emerich and associates discusses some of the possibilities of cell immunoisolation and the potential for treating central nervous system diseases
