Radionuclide Imaging In Drug Research:

Radionuclide Imaging in Drug Research Clive G. Wilson, 2012-12-06 The use of gamma emitting radionuclides for diagnostic imaging in nuclear medicine has been established for many years Sophisticated gamma ray detecting camera systems and computer links enable the clinical investigator to image different regions of the body and to quantify organ function Parallel developments have also occurred in the field of radiopharmaceuticals and today a wide range of products is available that will exhibit specific uptake within target tissues following parenteral administration For example radioiodide is taken up by the thyroid and iodinated fatty acids can be used to image the myocardium Labelled antibodies have been used with success to target certain tumours The concept of targeting has also been considered by pharmaceutical scientists who wish to deliver drugs rather than radionuclides to specific sites in the body The systems that have been employed are often physically similar to those used as radiopharmaceuticals for example colloids aerosols and liposomes Furthermore pioneering work by Digenis and others in the United States States and by Alpsten and co workers 1976 in Sweden had demonstrated the potential of gamma scintigraphy for investigating the fate of tablets and capsules in the gastrointestinal tract of man in a non invasive way In 1979 the Biopharmaceutics Research Group at Nottingham together with academic pharmacists from Manchester held a one day symposium at Nottingham University to discuss how radio nuclides could be used in drug formulation studies to provide better approaches for the delivery of drugs to their sites of action

Nuclear Imaging in Drug Discovery, Development, and Approval BURNS, 2012-12-06 It is the purpose and business of the pharmaceutical industry to discover develop and make available drugs for the care of the sick The purpose of universities and national laboratories is to provide people and scientific knowledge that can help in the process This book presents the combined efforts of scientists from the drug industry academic laboratories and national laboratories to describe advances in radiotracer technology in studies on experimental animals and living human beings The authors believe that the technology is now ready for widespread application in the pharmaceutical industry The goal of this book is to help bring this about The field of Nuclear Medicine is based on the concept that if treatment of disease is chemical the patient's diagnosis should be chemical Anatomy and histopathology have been the principle basis for making a diagnosis Histopathologic data suffer from being descriptive subjective not quantifiable and based on the study of dead tissue The era of histopathology as the dominant concept in medical practice is coming to an end Histopathologic findings are often heterogeneous and a single biopsy will at times not reveal the true nature of the disease such as the grading of malignancy Far greater accuracy of staging of disease and in the planning of treatment is possible through chemistry as well as by making possible a more suitable selection of a histological biopsy site
