Kapoor, 2008-01-01 With the decline in world fish stocks our knowledge of fish reproduction has become fundamental Reproduction is an essential commitment to future generation It is also a continuous development process throughout ontogeny requiring energetic ecological physiological anatomical biochemical and endocrinological adaptations The first chapters highlight important issues affecting fish normal ways of reproductive development details would focus on species

living in opposite environments such as tropical and polar fishes far related as teleosts and cartilaginous fishes and finally fish having different reproductive strategies Thereafter since many fishes live in detrimental environments mainly induced by the continuous input of xenobiotic substances into waterways the authors found it highly pertinent to include this topic Herein the authors fix their attention on the factors and mechanisms that may well affect reproduction related hormonal systems as also on known consequences for fish living i

Welfare and Stressors in Fish:

Challenges Facing Aquaculture Leonardo Julián Magnoni, Juan Antonio Martos-Sitcha, Patrick Prunet, Juan Miguel Mancera, 2020-03-26 Consumers producers stakeholders governmental regulatory agencies and NGOs are becoming increasingly concerned with the conditions in which aquatic organisms are reared worldwide High demand for fish for human consumption represents a challenge that has to be fulfilled by an ever growing aquaculture production In this scenario animal care over the entire life and production cycle must be guaranteed while avoiding significant economic losses As a result research is needed to maximize yields and minimize adverse outcomes by optimizing rearing conditions while keeping in mind the welfare of cultured fish In this Research Topic we will focus on relevant aspects related to fish response to both biotic and abiotic stressors as a means of improving their welfare integrating both physiological and behavioral responses In fish the adaptive responses to rearing may differ depending on several factors including the characteristics of the stimuli and the intrinsic properties of the species or the selected line If complete adaptation is missing the application of single or multiple stimuli may result in a stress response Stress responses have been linked to systemic adjustments which negatively impacts the immune system of fish as well as their growth and reproductive performance Therefore one of the main interests of this Topic is to understand the allostatic responses of aquatic organisms to several stimuli factors that may be present during rearing An additional focus of this Topic will be on conditions that may improve fish welfare by decreasing the stress response such as implementing adequate swimming conditions The focus of the Topic is to contribute to our present knowledge to better understand the physiological response of aquatic organisms which is central to improving aquaculture practices Emphasis will be placed on potentially existing interactions between physiological and endocrine pathways to build an overall stress response Another aspect that will be considered in this Topic is how intraspecific variability may affect the stress response

Fish Physiology: Behaviour and Physiology of Fish Katherine A. Sloman, Sigal Balshine, Rod W. Wilson, 2005-12-13 Traditionally behaviour and physiology have been considered two separate fields of biology with the majority of available literature focusing on one or the other Recently the need for a multidisciplinary approach to these topics has been realised highlighted by some of the sessions to be held at the 2003 annual meeting of the Society for Integrative and Comparative Biology such as regulation of behaviour and mechanisms of behaviour The proposed volume aims to bring together these disciplines in a comprehensive review of the available literature Fish Physiology Behaviour and Physiology of Fish will be novel in actively bridging these two areas of fish biology together and considering them as inextricably linked The progression of chapters focuses on different aspects of the life history of a fish from predator avoidance through to reproduction each written by scientists currently bridging the gap between behaviour and physiology in their own specialised subdiscipline Multidisciplinary and integrative research in fish biology Written by internationally recognized researchers Encompasses the whole life span of fish A wide variety of inter related topics presented in a cohesive format
