Autonomous Flying Robots

Kenzo Nonami, Farid Kendoul, Satoshi Suzuki, Wei Wang, Daisuke Nakazawa, 2010-09-15 The advance in robotics has boosted the application of autonomous vehicles to perform tedious and risky tasks or to be cost effective substitutes for their man counterparts Based on their working environment a rough classification of the autonomous vehicles would include unmanned aerial vehicles UAVs manned ground vehicles UGVs autonomous underwater vehicles AUVs and autonomous surface vehicles ASVs UAVs UGVs AUVs and ASVs are called UVs unmanned vehicles nowadays In recent decades the development of manned autonomous vehicles have been of great interest and different kinds of autonomous vehicles have been studied and developed all over the world In particular UAVs have many applications in emergency situations humans often cannot come

close to a dangerous natural disaster such as an earthquake a ood an active volcano or a nuclear disaster Since the development of the rst UAVs research efforts have been focused on military applications Recently however demand has arisen for UAVs such as aero robotsand ying robotsthat can be used in emergency situations and in industrial applications Among the wide variety of UAVs that have been developed small scale HUAVs helicopter based UAVs have the ability to take off and land vertically as well as the ability to cruise in ight but their most importantcapability is hovering Hoveringat a point enables us to make more eff tive observations of a target Furthermore small scale HUAVs offer the advantages of low cost and easy operation

Mobile Robot: Motion Control and Path Planning Ahmad Taher Azar,Ibraheem Kasim Ibraheem,Amjad Jaleel Humaidi,2023-06-30 This book presents the recent research advances in linear and nonlinear control techniques From both a theoretical and practical standpoint motion planning and related control challenges are key parts of robotics Indeed the literature on the planning of geometric paths and the generation of time based trajectories while accounting for the compatibility of such paths and trajectories with the kinematic and dynamic constraints of a manipulator or a mobile vehicle is extensive and rich in historical references Path planning is vital and critical for many different types of robotics including autonomous vehicles multiple robots and robot arms In the case of multiple robot route planning it is critical to produce a safe path that avoids colliding with objects or other robots When designing a safe path for an aerial or underwater robot the 3D environment must be considered As the number of degrees of freedom on a robot arm increases so does the difficulty of path planning As a result safe pathways for high dimensional systems must be developed in a timely manner Nonetheless modern robotic applications particularly those requiring one or more robots to operate in a dynamic environment e g human robot collaboration and physical interaction surveillance or exploration of unknown spaces with mobile agents etc pose new and exciting challenges to researchers and practitioners For instance planning a robot s motion

in a dynamic environment necessitates the real time and online execution of difficult computational operations The development of efficient solutions for such real time computations which could be offered by specially designed computational architectures optimized algorithms and other unique contributions is thus a critical step in the advancement of present and future oriented robotics
