Modeling, Simulation, And Control

Of Flexible Manufacturing Systems: A Petri Net Approach Kurapati Venkatesh, Mengchu Zhou, 1999-01-29 One critical barrier leading to successful implementation of flexible manufacturing and related automated systems is the ever increasing complexity of their modeling analysis simulation and control Research and development over the last three decades has provided new theory and graphical tools based on Petri nets and related concepts for the design of such systems The purpose of this book is to introduce a set of Petri net based tools and methods to address a variety of problems associated with the design and implementation of flexible manufacturing systems FMSs with several implementation examples There are three ways this book will directly benefit readers First the book will allow engineers and managers who are responsible for the design and implementation of modern manufacturing systems to evaluate Petri nets for applications in their work Second it will provide sufficient breadth and depth to allow development of Petri net based industrial applications Third it will allow the basic Petri net material to be taught to industrial practitioners students and academic researchers much more efficiently This will foster further research and applications of Petri nets in aiding the successful implementation of advanced manufacturing systems

Design of Flexible Production Systems Tullio Tolio, 2008-12-11 In the last decade the production of mechanical components to be assembled in final products produced in high volumes e g cars mopeds industrial vehicles etc has undergone deep changes due to the overall modifications in the way companies compete Companies must consider competitive factors such as short lead times tight product tolerances frequent market changes and cost reduction Anyway companies often have to define production objectives as trade offs among these critical factors since it can be difficult to improve all of them Even if system flexibility is often considered a fundamental requirement for firms it is not always a desirable characteristic of a system because it requires relevant investment cost which can jeopardize the profitability of the firm Dedicated systems are not able to adapt to changes of the product characteristics while flexible systems offer more flexibility than what is needed thus increasing investment and operative costs Production contexts characterized by mid to high demand volume of well identified families of products in continuous evolution do not require the highest level of flexibility therefore manufacturing system flexibility must be rationalized and it is necessary to find out the best trade off between productivity and flexibility by designing manufacturing systems endowed with the right level of flexibility required by the production problem This new class of production systems can be named Focused Flexibility Manufacturing Systems FFMSs The flexibility degree in FFMSs is related to their ability to cope with volume mix and technological changes and it must take into account both present and future changes The required level of system flexibility impacts on the architecture of the system and the explicit design of flexibility often leads to hybrid systems i e automated integrated systems in which parts can be processed by both general purpose and dedicated machines This is a key issue of FFMSs and results from the

matching of flexibility and productivity that respectively characterize FMSs and Dedicated Manufacturing Systems DMSs The market share of the EU in the machine tool sector is 44% the introduction of focused flexibility would be particularly important for machine tool builders whose competitive advantage is based on the ability of customizing their systems on the basis of needs of their customers In fact even if current production contexts frequently present situations which would fit well with the FFMS approach tradition and know how of machine tool builders play a crucial role Firms often agree with the focused flexibility vision nevertheless they decide not to pay the risk and efforts related to the design of this new system architecture This is due also to the lack of well structured design approaches which can help machine tool builders to configure innovative systems Therefore the FFMS topic is studied through the book chapters following a shared mission To define methodologies and tools to design production systems with a minimum level of flexibility needed to face during their lifecycle the product and process evolution both in the technological and demand aspects The goal is to find out the optimal trade off between flexibility and productivity The book framework follows the architecture which has been developed to address the FFMS Design problem This architecture is both broad and detailed since it pays attention to all the relevant levels in a firm hierarchy which are involved in the system design Moreover the architecture is innovative because it models both the point of view of the machine tool builder and the point of view of the system user The architecture starts analyzing Manufacturing Strategy issues and generating the possible demand scenario to be faced Technological aspects play a key role while solving process plan problems for the products in the part family Strategic and technological data becomes input when a machine tool builder performs system configuration The resulting system configurations are possible solutions that a system user considers when planning its system capacity All the steps of the architecture are deeply studied developing methods and tools to address each subproblem Particular attention is paid to the methodologies adopted to face the different subproblems mathematical programming stochastic programming simulation techniques and inverse kinematics have been used The whole architecture provides a general approach to implement the right degree of flexibility and it allows to study how different aspects and decisions taken in a firm impact on each other The work presented in the book is innovative because it gives links among different research fields such as Manufacturing Strategy Process Plan System Design Capacity Planning and Performance Evaluation moreover it helps to formalize and rationalize a critical area such as manufacturing system flexibility The addressed problem is relevant at an academic level but also at an industrial level A great deal of industrial sectors need to address the problem of designing systems with the right degree of flexibility for instance automotive white goods electrical and electronic goods industries etc Attention to industrial issues is confirmed by empirical studies and real case analyses which are presented within the book chapters

Optimal Design of Flexible Manufacturing Systems Ulrich A.W. Tetzlaff, 2013-03-09 Flexible manufacturing systems are complex production systems with considerable high investment costs This book intends to show the reader how the design of such a system can be optimized Thereby it addresses the academic world in management science and industrial engineering as well as system planners in industry First the design problems are analysed in detail and a planning concept is presented Afterwards possible tools for the design process are described as there are mathematical programming queueing networks computer simulation perturbation analysis petri nets group technology and knowledge based systems The major part of the book however concerns the description of existing optimization models based on mathematical programming Each model is explained and discussed in detail and for new models developed by the author numerical examples are given Finally some distinct guidelines are presented which help the system planners to select the appropriate model for their planning problems

Flexible Manufacturing Systems in Practice Joseph Talavage, 1987-12-18 This authoritative guide provides a logical progressive overview of the industrial realities of flexible manufacturing and will prove invaluable for manufacturing industrial production design mechanical systems and operations engineers

Flexible Manufacturing Systems: Recent Developments A. Raouf, M. Ben-Daya, 1995-02-09 Flexible Manufacturing Systems FMS involve substituting machines capable of performing a wide and redefinable variety of tasks for machines dedicated to the performance of specific tasks FMS can also be programmed to handle new products thus extending the machines life cycles Thus they represent a change from standardized goods produced by customized machines to customized goods produced by standardized machines This volume contains new and updated material in this field and will be of great interest to researchers managers and students concerned with problems related to flexible manufacturing systems
