Composition Modulation of Catalytic Reactors P. L. Silvertown, 1998-11-26. Composition modulation is a method of operating a catalytic reactor to improve catalyst activity or selectivity and has been under study for more than 25 years. In the last few years, several commercial applications have been realized and more will certainly appear. A large international research literature now exists. This book examines this literature and attempts to organize and analyze it with the intent of identifying the magnitude of improvements possible, why modulation is effective, and what questions remain unanswered. Topics include hydrogenation, oxidation, reduction, and polymerization reactions for NO_x, SO_x, NH₃, and hydrocarbons.

Handbook of Membrane Reactors Angelo Basile, 2013-02-08. Membrane reactors are increasingly replacing conventional separation processes and conversion technologies across a wide range of applications. Exploiting advanced membrane materials, they offer enhanced efficiency, are very adaptable, and have great economic potential. There has therefore been increasing interest in membrane reactors from both the scientific and industrial communities stimulating research and development. The two volumes of the Handbook of membrane reactors draw on this research to provide an authoritative review of this important field. Volume 1 explores fundamental materials science, design, and optimisation, beginning with a review of polymeric, dense, metallic, and composite membranes for membrane reactors. In part one, Polymeric and nanocomposite membranes for membrane reactors, inorganic membrane reactors for hydrogen production, palladium based composite membranes, and alternatives to palladium based

membranes for hydrogen separation in membrane reactors are all discussed Part two goes on to investigate zeolite ceramic and carbon membranes and catalysts for membrane reactors in more depth Finally part three explores membrane reactor modelling simulation and optimisation including the use of mathematical modelling computational fluid dynamics artificial neural networks and non equilibrium thermodynamics to analyse varied aspects of membrane reactor design and production enhancement With its distinguished editor and international team of expert contributors the two volumes of the Handbook of membrane reactors provide an authoritative guide for membrane reactor researchers and materials scientists chemical and biochemical manufacturers industrial separations and process engineers and academics in this field Considers polymeric dense metallic and composite membranes for membrane reactors Discusses ceramic and carbon for membrane reactors in detail Reactor modelling simulation and optimisation is also discussed
