Telepresence P.J. Sheppard,G.R. Walker,2012-12-06

Telepresence is enabling human interaction at a distance creating a sense of being present at a remote location In the next

millennium we are certain to be increasingly telepresent both at work and at play with an expanding market for telepresence services As we move from a physical to an information economy demand will grow for services which transport bits not atoms and which support the output of the human mind Moreover technology continues to advance at an unprecedented rate and it could be suggested that we are reaching key breakpoints in client processing power and global network interconnectivity In practice telepresence systems utilise a very wide range of technologies In compiling this book the editors have included chapters from across these technologies which they have broadly classified as audio data video and virtual environments Telepresence gives a flavour of the exciting developments in telepresence and teleconferencing technologies being researched and developed within BT Just as the telephone began changing the world a century ago so will telepresence one day alter the way we live think do business and react to the world around us The potential for these technologies is staggering the implications mind boggling Building on a strong base of established audiovisual conferencing and interactive multimedia services BT and MCI are leading the way in defining the commercial applications of telepresence that will shape the future of global telecommunication Telepresence is a snapshot of these groundbreaking activities and conveys the complexity uncertainty and enthusiasm involved in this challenging and exciting work It is essential reading for all researchers engineers and managers working in this stimulating field *The Internet and Beyond* S.P. Sim,J.

Davies,2012-12-06 We live in exciting times We have over the last few years seen the birth of a new telecommunications service which will fundamentally change the way we live much as the telephone has over the last 100 years The birth of the Internet can be traced back to a conference on computer communications held in 1972 As a result of that conference a working group was set up under the chairmanship of Vint Cerf to propose new protocols to facilitate computer communications In 1974 the working group published the transmission control protocol TCP and the Interworking protocol IP These were rapidly adopted and the number of computers linked using these protocols has almost doubled every year since Thus the Internet was born Another major step happened in 1990 Tim Berners Lee a Scottish nuclear physicist working at CERN created some higher level protocols These still used TCP IP for the networking but defined how computers could communicate multimedia information and be linked together to form a World Wide Web of information A number of computer databases adopted these protocols and things really took off in 1993 when Marc Andreessen at the University of Illinois developed Mosaic the first client software a browser that gave a windows style interface to these databases Data Network Engineering Tim King,Dave Newson,2012-12-06 It is certain that over the next few years data traffic will dwarf voice traffic on telecommunications networks Growth in data traffic volumes far exceeds that for voice and is driven by increased use of applications such as e mail attachments remote printing and fileservers access and the now omnipresent World Wide Web The growth of data networking to connect computers with each other and with their peripheral devices began in earnest in the 1970s took off in the 1980s and exploded in the 1990s The early 21st century will see ever faster

more cost effective networks providing flexible data access into ever more businesses and homes Since the 1970s there have been great advances in technology For the past twenty years the processing power of computers has continued to grow with no hint of slowing recall the oft cited Moore s Law claiming that this power doubles every 18 months Advances in the data networking equipment required to support the data traffic generated have been enormous The pace of development from early X 25 and modem technology through to some of the advanced equipment functionality now available is breathtaking it is sometimes hard to believe that the practical router is barely ten years old This book provides an overview of the advanced data networking field by bringing together chapters on local area networks wide area networks and their application
