Models For Infectious Human Diseases:

Models for Infectious Human Diseases Valerie Isham, Graham Medley, 1996-03-29 Infectious disease accounts for more death and disability globally than either non infectious disease or injury This book contains a breadth of different quantitative approaches to understanding the patterns of infectious diseases in populations and the design of control strategies to lessen their effect The contributors bring a great variety of mathematical expertise including deterministic and stochastic modelling and statistical data analysis and involvement in a wide range of applied fields across the spectrum of biological medical and social sciences The aim is to increase interaction between specialities by describing research on many of the infectious diseases that affect humans including both viral diseases like measles and AIDS and tropical parasitic infections The papers are divided into groups dealing with problems relating to transmissible diseases vaccination strategies the consequences of treatment interventions the dynamics of immunity heterogeneity of populations and prediction

Modeling Infectious Diseases in Humans and Animals Matt J. Keeling, Pejman Rohani, 2011-09-19 For epidemiologists evolutionary biologists and health care professionals real time and predictive modeling of infectious disease is of growing importance This book provides a timely and comprehensive introduction to the modeling of infectious diseases in humans and animals focusing on recent developments as well as more traditional approaches Matt Keeling and Pejman Rohani move from modeling with simple differential equations to more recent complex models where spatial structure seasonal forcing or stochasticity influence the dynamics and where computer simulation needs to be used to generate theory In each of the eight chapters they deal with a specific modeling approach or set of techniques designed to capture a particular biological factor They illustrate the methodology used with examples from recent research literature on human and infectious disease modeling showing how such techniques can be used in practice Diseases considered include BSE foot and mouth HIV measles rubella smallpox and West Nile virus among others Particular attention is given throughout the book to the development of practical models useful both as predictive tools and as a means to understand fundamental epidemiological processes To emphasize this approach the last chapter is dedicated to modeling and understanding the control of diseases through vaccination quarantine or culling Comprehensive practical introduction to infectious disease modeling Builds from simple to complex predictive models Models and methodology fully supported by examples drawn from research literature Practical models aid students understanding of fundamental epidemiological processes For many of the models presented the authors provide accompanying programs written in Java C Fortran and MATLAB In depth treatment of role of modeling in understanding disease control

Experimental Animal Models of Human Diseases Bartholomew Ibeh,2018-05-23 The world has recorded losses in terms of human life as well as extensive time spent in experimentation with development of new drugs elucidation of disease mechanism s and therapeutic agent discovery Ethical and legal issues cojoin in slowing down scientific discoveries in medicine and biology The past two 2 decades therefore have seen tremendous attempts that largely are successful in developing animal models with the characteristics of mimicking approximating or expressing transplanted human organs tissues These models or rather approaches seem to be fast cost effective and easy to maintain compared to primates This book is a collection of expert essays on animal models of human diseases of global interest A visible objective of the book is to provide real time experimental approach to scientists clinicians ethicists medicolegal medical jurisprudence workers immunologists postgraduate students and vaccinologists and informative and multidisciplinary approach for the identification of new therapeutic targets and biomarkers using animal models as well as investigating the pathogenesis and therapeutic strategies of human diseases An increased understanding of the genetic molecular and cellular mechanisms responsible for the development of human diseases has laid out the foundation for the development of rational therapies mainly with animal models *Modeling Infectious Disease Parameters Based on Serological and Social Contact Data* Niel Hens,Ziv Shkedy,Marc Aerts,Christel Faes,Pierre Van Damme,Philippe Beutels,2012-10-24 Mathematical epidemiology of infectious diseases usually involves describing the flow of individuals between mutually exclusive infection states One of the key parameters describing the transition from the susceptible to the infected class is the hazard of infection often referred to as the force of infection The force of infection reflects the degree of contact with potential for transmission between infected and susceptible individuals The mathematical relation between the force of infection and effective contact patterns is generally assumed to be subjected to the mass action principle which yields the necessary information to estimate the basic reproduction number another key parameter in infectious disease epidemiology It is within this context that the Center for

Statistics CenStat I Biostat Hasselt University and the Centre for the Evaluation of Vaccination and the Centre for Health Economic Research and Modelling Infectious Diseases CEV CHERMID Vaccine and Infectious Disease Institute University of Antwerp have collaborated over the past 15 years This book demonstrates the past and current research activities of these institutes and can be considered to be a milestone in this collaboration This book is focused on the application of modern statistical methods and models to estimate infectious disease parameters We want to provide the readers with software guidance such as R packages and with data as far as they can be made publicly available

Mathematics in Population Biology Horst R. Thieme, 2018-06-05 The formulation analysis and re evaluation of mathematical models in population biology has become a valuable source of insight to mathematicians and biologists alike This book presents an overview and selected sample of these results and ideas organized by biological theme rather than mathematical concept with an emphasis on helping the reader develop appropriate modeling skills through use of well chosen and varied examples Part I starts with unstructured single species population models particularly in the framework of continuous time models then adding the most rudimentary stage structure with variable stage duration The theme of stage structure in an age dependent context is developed in Part II covering demographic concepts such as life expectation and variance of life length and their dynamic consequences In Part III the author considers the dynamic interplay of host and parasite populations i e the epidemics and endemics of infectious diseases The theme of stage structure continues here in the analysis of different stages of infection and of age structure that is instrumental in optimizing vaccination strategies Each section concludes with exercises some with solutions and suggestions for further study The level of mathematics is relatively modest a toolbox provides a summary of required results in differential equations integration and integral equations In addition a selection of Maple worksheets is provided The book provides an authoritative tour through a dazzling ensemble of topics and is both an ideal introduction to the subject and reference for researchers
