Models Of Neuropeptide Action:

Models of Neuropeptide Action Fleur L. Strand, 1994 This work concentrates on specialised models of neuropeptide action The papers in this first section conclude that actions of neuropeptides are highly specific with specificity related not only to the peptide but also to dosage pattern and timing of administration tissue substrate and age The impact of neuropeptide action in behaviour relating to ingestion epilepsy and alcohol is also addressed Maternal foetal interactions are discussed as is peptide regulation during development and regeneration An evaluation of the interrelationship between cytokines and neuropeptides is included and promises to provide a model for the study of both systems in the future

Neuropeptide GPCRs in neuroendocrinology Jae Young Seong, Hubert Vaudry, 2014-11-07 The human genome encompasses 860 G protein coupled receptors GPCRs including 374 non chemosensory GPCRs Half of these latter GPCRs recognize neuro peptides as natural ligands GPCRs thus play a pivotal role in neuroendocrine communication In particular GPCRs are involved in the neuroendocrine control of feeding behavior reproduction growth hydromineral homeostasis and stress response GPCRs are also major drug targets and hence possess a strong potential for the development of innovative pharmaceuticals The aim of this Research Topic was to assemble a series of review articles and original research papers on neuropeptide GPCRs and their ligands that would illustrate the different facets of the studies currently conducted in this domain

Molecular Model Systems in the Lepidoptera Marian R. Goldsmith, Adam S. Wilkins, 1995-04-28 This book presents a diverse collection of chapters on basic research at the molecular level using Lepidoptera as model systems This volume however is more than just a compendium of information about insect systems in general or the Lepidoptera in particular Each chapter is a self contained treatment of a broad subject area providing sufficient background information to give readers a sense of the guiding principles and central questions associated with each topic in addition to major methodologies and findings Comparisons with other major model systems are emphasized with special attention given to the fruit fly *Drosophila melanogaster* Topics include genetics mobile elements embryogenesis silk gland and chorion gene regulation hormone action neurobiology the immune response and engineered baculoviruses Molecular and developmental biologists at graduate and researcher levels will find this book of great interest

Model Neural Networks and Behavior Allen Selverston, 2013-06-29 The most conspicuous function of the nervous system is to control animal behavior From the complex operations of learning and mentation to the molecular configuration of ionic channels the nervous system serves as the interface between an animal and its environment To study and understand the fundamental mechanisms underlying the control of behavior it is often both necessary and desirable to employ biological systems with characteristics especially suitable for answering specific questions In neurobiology many invertebrates have become established as model systems for investigations at both the systems and the cellular level Large readily identifiable neurons have made invertebrates especially useful for cellular studies The fact that these neurons occur in much smaller

numbers than those in higher animals also makes them important for circuit analysis Although important differences exist some of the questions that would be technically impossible to answer with vertebrates can become experimentally tractable with invertebrates

Model Animals in Neuroendocrinology Mike Ludwig, Gil Levkowitz, 2018-08-30 Model Animals in Neuroendocrinology From Worm to Mouse to Man offers a masterclass on the opportunities that different model animals offer to the basic understanding of neuroendocrine functions and mechanisms of action and the implications of this understanding The authors review recent advances in the field emanating from studies involving a variety of animal models molecular genetics imaging technologies and behavior assays These studies helped unravel mechanisms underlying the development and function of neuroendocrine systems The book highlights how studies in a variety of model animals including invertebrates fish birds rodents and mammals has contributed to our understanding of neuroendocrinology Model Animals in Neuroendocrinology provides students scientists and practitioners with a contemporary account of what can be learnt about the functions of neuroendocrine systems from studies across animal taxonomy This is the seventh volume in the Masterclass in Neuroendocrinology Series a co publication between Wiley and the INF International Neuroendocrine Federation that aims to illustrate highest standards and encourage the use of the latest technologies in basic and clinical research and hopes to provide inspiration for further exploration into the exciting field of neuroendocrinology

Synaptic Transmission Stephen D. Meriney, Erika Fanselow, 2019-06-12 Synaptic Transmission is a comprehensive guide to the topic of neurotransmission that provides an in depth discussion on many aspects of synapse structure and function a fundamental part of the neuroscience discipline Chapters include boxes that describe renowned award winning researchers and their contributions to the field of synaptic transmission diseases relevant to the material presented details of experimental approaches used to study synaptic transmission and interesting asides that expand on topics covered This book will inspire students to appreciate how the basic cellular and molecular biology of the synapse can lead to a better understanding of nervous system function and neurological disorders Provides a comprehensive reference on synaptic structure physiology function and neurotransmission Discusses many landmark experiments in the field of synaptic transmission to emphasize core principles Includes references to primary scientific literature relevant review articles and books many of which could be assigned as discussion material for courses focused on this topic

Neuropeptide Systems as Targets for Parasite and Pest Control Timothy G. Geary, Aaron Maule, 2011-01-13 The need to continually discover new agents for the control or treatment of invertebrate pests and pathogens is undeniable Agriculture both animal and plant succeeds only to the extent that arthropod and helminth consumers vectors and pathogens can be kept at bay Humans and their companion animals are also plagued by invertebrate parasites The deployment of chemical agents for these purposes inevitably elicits the selection of resistant populations of the targets of control necessitating a regular introduction of new kinds of molecules Experience in other areas of chemotherapy has shown that a thorough understanding of the biology of disease is an essential platform upon

which to build a discovery program Unfortunately investment of research resources into understanding the basic physiology of invertebrates as a strategy to illuminate new molecular targets for pesticide and parasiticide discovery has been scarce and the pace of introduction of new molecules for these indications has been slowed as a result An exciting and so far unexploited area to explore in this regard is invertebrate neuropeptide physiology This book was assembled to focus attention on this promising field by compiling a comprehensive review of recent research on neuropeptides in arthropods and helminths with contributions from many of the leading laboratories working on these systems

Behavioural Models in Psychopharmacology Paul Willner, 1991-02-21 Behavioural models in psychopharmacology are used for different purposes The main concern of industrial psychopharmacologists is specifically to develop new and improved drugs for the treatment of mental disorders while basic scientists use animal models to investigate the underlying nature of such conditions The important distinction between these different perspectives is made explicit for the first time in this book By considering such conditions as anxiety depression mania and schizophrenia feeding disorders dementia and drug dependence this book provides a comprehensive and critical review of the adequacy of the behavioural procedures used by psychopharmacologists to model psychiatric disorders Graduate students and research workers in psychopharmacology from both academic and industrial spheres as well as clinicians will find this book of considerable interest

Modeling Neuropsychiatric Disorders in Laboratory Animals Kurt Leroy Hoffman, 2015-08-28 Modeling Neuropsychiatric Disorders in Laboratory Animals serves as a guide for students and basic investigators in the fields of behavioral sciences psychology neuroscience psychiatry and other professionals interested in the use of animal models in preclinical research related to human neuropsychiatric disorders The text focuses on the rationale and theory of using animal behavior both pathological and normal as a tool for understanding the neural underpinnings of neuropsychiatric disorders Chapters contain discussions on both classical and modern views on the validation of animal models for neuropsychiatric disorders also discussing the utility of endophenotypes in modeling neuropsychiatric disease Subsequent chapters deal with four specific classes of disorders including anxiety disorders depressive disorders obsessive compulsive and related disorders Final sections discuss the future for the development validation and use of animal models in basic and preclinical research Focuses on the rationale and theory of using animal behavior both pathological and normal as a tool for understanding the neural underpinnings of neuropsychiatric disorders Serves as a guide for students and basic investigators in the fields of behavioral sciences psychology neuroscience psychiatry and other professionals Discusses specific classes of disorders including anxiety disorders depressive disorders obsessive compulsive and related disorders
