Models For Movers:

Moving Objects Management Xiaofeng Meng, Jidong Chen, 2011-01-27 We live in an age of rapid technological development. The Internet already affects our lives in many ways. Indeed we continue to depend more and more intrinsically on the Internet which is increasingly becoming a fundamental piece of societal infrastructure just as water supply, electricity grids and transportation networks have been for a long time. But while these other infrastructures are relatively static, the Internet is undergoing swift and fundamental change. Notably the Internet is going mobile. The world has some 6.7 billion humans, 4 billion mobile phones and 1.7 billion Internet users. The two most populous continents, Asia and Africa, have relatively low Internet penetration and hold the greatest potentials for growth. Their mobile phone users by far outnumber their Internet users and the numbers are growing rapidly. China and India are each gaining about half a dozen million new phone users per month. Users across the globe as a whole increasingly embrace mobile Internet devices with smart phone sales starting to outnumber PC sales. Indeed these and other facts suggest that the Internet stands to gain a substantial mobile component. This mega trend towards mobile is enabled by rapid and continuing advances in key technology areas such as mobile communication, consumer electronics, GPS positioning and computing. In short, this is the backdrop for this very timely book on moving objects by Xiaofeng Meng and Jidong Chen.

Queueing Systems with Moving Servers Yuri Belyaev, Asaf Hajiyeu, 2025-10-28 Queueing theory methods are employed in managing traffic flows, shipping facilities, communication systems, vertical transportation and others. The study of such systems is outside the framework of the methods of classical queueing theory; thus new methodologies such as systems with moving servers have evolved. These systems are different and have complicated structures but they have one common ideology: i.e. systems with moving servers. The book is dedicated to constructing and investigating mathematical models of queueing systems with moving servers. It is meant for researchers who are working in the application of mathematical methods in various fields: traffic, communication systems and others; mathematicians in the field of queueing systems; also researchers who are interested in the construction and investigation of mathematical models of queueing systems with moving servers. The theoretical results are demonstrated on numerical examples.

Moving Finite Element Method Maria do Carmo Coimbra, Alirio Egidio Rodrigues, Jaime Duarte Rodrigues, Rui Jorge Mendes Robalo, Rui Manuel Pires Almeida, 2016-11-30 This book focuses on process simulation in chemical engineering with a numerical algorithm based on the moving finite element method (MFEM). It offers new tools and approaches for modeling and simulating time dependent problems with moving fronts and with moving boundaries described by time dependent convection reaction diffusion partial differential equations in one or two dimensional space domains. It provides a comprehensive account of the development of the moving finite element method describing and analyzing the theoretical and practical aspects of the MFEM for models in 1D, 1D, 1d and 2D space domains.

Mathematical models are universal and the book reviews successful applications of MFEM to solve engineering problems. It covers a broad range of application algorithm to engineering problems namely on separation and reaction processes presenting and discussing relevant numerical applications of the moving finite element method derived from real world process simulations.

Dynamics of the Axially Moving Orthotropic Web Krzysztof Marynowski, 2008-09-26 A material continuum moving axially at high speed can be met in numerous different technical applications. These comprise band saws web papers during manufacturing processing and printing processes textile bands during manufacturing and processing pipes transporting fluids transmission belts as well as flat objects moving at high speeds in space. In all these so varied technical applications the maximum transport speed or the transportation speed is aimed at in order to increase efficiency and optimize investment and performance costs of sometimes very expensive and complex machines and installations. The dynamic behavior of axially moving systems very often hinders from reaching these aims. The book is devoted to dynamics of axially moving material objects of low flexural stiffness that are referred to as webs. Webs are moving at high speed for example in paper production the paper webs are transported with longitudinal speeds of up to 3000 m/min. Above the critical speed one can expect various dynamical instabilities mainly of divergent and flutter type. The up to date state of investigations conducted in the field of the axially moving system dynamics is presented in the beginning of the book. Special attention is paid on nonlinear dynamic investigations of translating systems. In the next chapters various mathematical models that can be employed in dynamic investigations of such objects and the results of analysis of the dynamic behavior of the axially moving orthotropic material web are presented. To make tracing the dynamic considerations easier a paper web is the main object of investigations in the book.

Control of Axially Moving Systems Keum-Shik Hong, Li-Qun Chen, Phuong-Tung Pham, Xiao-Dong Yang, 2021-10-19 This book provides a comprehensive guideline on dynamic analysis and vibration control of axially moving systems. First the mathematical models of various axially moving systems describing the string beam belt and plate models are developed. Accordingly dynamical issues such as the equilibrium configuration critical velocity stability bifurcation and further chaotic dynamics are analyzed. Second this book covers the design of the control schemes based on the hitherto control strategies for axially moving systems: feedback control using the transfer function variable structure control control by regulating the axial velocity wave cancellation approach boundary control using the Lyapunov method adaptive control and hybrid control methods. Finally according to the contents discussed in the book specific aspects are outlined for initiating future research endeavors to be undertaken concerning axially moving systems. This book is useful to graduate students and researchers in industrial sectors such as continuous manufacturing systems transport systems power transmission systems and lifting systems not to mention in academia.

Handbook of Marketing Decision Models Berend Wierenga, 2008-09-11 Marketing models is a core component of the marketing discipline. The recent developments in marketing models have been incredibly fast with information technology e.g. the Internet, online marketing, e-commerce and customer relationship management (CRM) creating radical changes in the way companies interact with their customers. This has created completely new breeds of marketing models but major progress has also taken place in existing types of marketing models. The HANDBOOK OF MARKETING DECISION MODELS presents the state of the art in marketing decision models dealing with new modeling areas such as customer relationship management, customer value and online marketing but also describes recent developments in other areas. In the category of marketing mix models, the latest models for advertising, sales, promotions, sales management and competition are dealt with. New developments are presented in consumer decision models, models for return on marketing, marketing management support systems and in special techniques such as time series and neural nets. Not only are the most recent models discussed but the book also pays attention to the implementation of marketing models in companies and to applications in specific industries.

Sign-based Methods in Linear Statistical Models M. V. Boldin, Galina I. Simonova, I_Uri_Nikolaevich Ti_urin, 1997-04-22 For nonparametric statistics, the last half of this century was the time when rank-based methods originated, were vigorously developed, reached maturity and received wide recognition. The rank-based approach in statistics consists in ranking the observed values and using only the ranks rather than the original numerical data. In fitting relationships to observed data, the ranks of residuals from the fitted dependence are used. The

signed based approach is based on the assumption that random errors take positive or negative values with equal probabilities Under this assumption the sign procedures are distribution free These procedures are robust to violations of model assumptions for instance to even a considerable number of gross errors in observations In addition sign procedures have fairly high relative asymptotic efficiency in spite of the obvious loss of information incurred by the use of signs instead of the corresponding numerical values In this work sign based methods in the framework of linear models are developed In the first part of the book there are linear and factor models involving independent observations In the second part linear models of time series primarily autoregressive models are considered
