Cole,1973 **Models of doom** H. S. S. Cole,1973 *EPA-600/5* ,1974-02 *Crisis of Global Sustainability* Tapio

Kanninen,2013 This concise and informative text provides a critical history of the concept of sustainability and the various institutional measures taken to promote implement and enforce sustainable development proposing new organizational solutions to deal with the crisis of sustainability *Crisis of Global Sustainability* provides for the first time a compact insider description of the evolution and impact of the Club of Rome a global think tank that produced a groundbreaking 1972 study *The Limits to Growth* which highlighted the dangers of unrestrained economic growth and possible collapse of global economy during the first decades of the 21st century With recent research confirming the validity of these concerns Kanninen asks whether our overarching concept of thinking on world development today should continue to be global sustainability which implies that we still have enough time to make adjustments in our future policies and action Or should the main paradigm of our thinking shift to global survivability a concept that stresses the absolute necessity of immediate and drastic change both in institutions and policies Many environmentalists green politicians and think tanks are speaking today more loudly than ever about the necessity for a major policy institutional and paradigm change and this work is essential reading for students and scholars alike **Environment and Society** Christopher Schlottmann,Dale

Jamieson,Colin Jerolmack,Anne Rademacher,2017-01-24 *Environment and Society* connects the core themes of environmental studies to the urgent issues and debates of the twenty first century In an era marked by climate change rapid urbanization and resource scarcity environmental studies has emerged as a crucial arena of study Assembling canonical and contemporary texts this volume presents a systematic survey of concepts and issues central to the environment in society such as social mobilization on behalf of environmental objectives the relationships between human population economic growth and stresses on the planet s natural resources debates about the relative effects of collective and individual action and unequal distribution of the social costs of environmental degradation Organized around key themes with each section featuring questions for debate and suggestions for further reading the book introduces students to the history of environmental studies and demonstrates how the field s interdisciplinary approach uniquely engages the essential issues of the present **The Visioneers** W. Patrick McCray,2017-06-06 The story of the visionary scientists who invented the future In 1969 Princeton physicist Gerard O Neill began looking outward to space colonies as the new frontier for humanity s expansion A decade later Eric Drexler an MIT trained engineer turned his attention to the molecular world as the place where society s future needs

could be met using self replicating nanoscale machines These modern utopians predicted that their technologies could transform society as humans mastered the ability to create new worlds undertook atomic scale engineering and if truly successful overcame their own biological limits The Visioneers tells the story of how these scientists and the communities they fostered imagined designed and popularized speculative technologies such as space colonies and nanotechnologies Patrick McCray traces how these visioneers blended countercultural ideals with hard science entrepreneurship libertarianism and unbridled optimism about the future He shows how they built networks that communicated their ideas to writers politicians and corporate leaders But the visioneers were not immune to failure or to the lures of profit celebrity and hype O Neill and Drexler faced difficulty funding their work and overcoming colleagues skepticism and saw their ideas co opted and transformed by Timothy Leary the scriptwriters of Star Trek and many others Ultimately both men struggled to overcome stigma and ostracism as they tried to unshackle their visioneering from pejorative labels like fringe and pseudoscience The Visioneers provides a balanced look at the successes and pitfalls they encountered The book exposes the dangers of promotion oversimplification misuse and misunderstanding that can plague exploratory science But above all it highlights the importance of radical new ideas that inspire us to support cutting edge research into tomorrow s technologies

Life Cycle Assessment of Energy Systems Nicholas Sakellariou, 2018-05-04 This groundbreaking work is the most in depth and state of the art study on the Life Cycle Assessment LCA of energy systems the only volume available on this critical subject Energy and sustainability are two of the most important and often most misunderstood subjects in our world today As these two subjects have grown in importance over the last few decades interest in the Life Cycle Assessment LCA model has grown as well as a potentially crucial tool in understanding and striving towards sustainability in energy systems Not just wind and solar systems but all energy systems need to be understood through this model Wind and solar power have the potential to decentralize the U S energy system by offering local communities electricity and economic support depending on the scale and design of projects Nevertheless every energy technology potentially faces environmental costs lay and expert opposition and risks to public health Engineers play a central role as designers builders and operators in energy systems As they extend their expertise into electrical mechanical and chemical fields from fossil fuel based systems to renewable energy systems sustainability is steadily becoming one of the key criteria engineers apply in their work This groundbreaking new study argues that engineering cultures foster sustainability by adopting assumptions and problem solving practices as part of their identities when designing and building engineering projects This work examines the politics of creating utilizing and modifying Life Cycle Assessment LCA in the construction of renewable energy systems The only volume of its kind ever written it is a must have for any engineer scientist manager or other professional working in or interested in Life Cycle Assessment and its relation to energy systems and impact on environmental and economic sustainability **The Limits of Technology and the End of History** Yefim Kats, 2024-10-12 This book examines the long standing belief in infinite scientific

and technological progress and links it to the Enlightenment ideal of man as a universal being and subject of the universal world history destined to become a master and possessor of nature The author analyzes a broad range of issues in epistemology the philosophy of history and the philosophy of science and technology Marx s philosophy is explored to the extent that his dialectic of labor sheds light on Western technological optimism and the ideal of human universality and offers an elaborate framework for analyzing the intrinsic limits to technological progress The focus is on his early works providing a theoretical and humanistic underbelly for the mature ideas of the Capital Examining the epistemic foundations of the belief in infinite progress the author argues that actual infinity either in the form of unbounded technological scientific expansion or infinite complexity of nature is redundant for the universality of man his scientific pursuit and historical experience The conundrum of universality and power calls for a systematic critique of instrumental reason its practical applicability and value structure

Environment, Scarcity, and Violence Thomas F. Homer-Dixon, 2010-07-01 The Earth s human population is expected to pass eight billion by the year 2025 while rapid growth in the global economy will spur ever increasing demands for natural resources The world will consequently face growing scarcities of such vital renewable resources as cropland fresh water and forests Thomas Homer Dixon argues in this sobering book that these environmental scarcities will have profound social consequences contributing to insurrections ethnic clashes urban unrest and other forms of civil violence especially in the developing world Homer Dixon synthesizes work from a wide range of international research projects to develop a detailed model of the sources of environmental scarcity He refers to water shortages in China population growth in sub Saharan Africa and land distribution in Mexico for example to show that scarcities stem from the degradation and depletion of renewable resources the increased demand for these resources and or their unequal distribution He shows that these scarcities can lead to deepened poverty large scale migrations sharpened social cleavages and weakened institutions And he describes the kinds of violence that can result from these social effects arguing that conflicts in Chiapas Mexico and ongoing turmoil in many African and Asian countries for instance are already partly a consequence of scarcity Homer Dixon is careful to point out that the effects of environmental scarcity are indirect and act in combination with other social political and economic stresses He also acknowledges that human ingenuity can reduce the likelihood of conflict particularly in countries with efficient markets capable states and an educated populace But he argues that the violent consequences of scarcity should not be underestimated especially when about half the world s population depends directly on local renewables for their day to day well being In the next decades he writes growing scarcities will affect billions of people with unprecedented severity and at an unparalleled scale and pace Clearly written and forcefully argued this book will become the standard work on the complex relationship between environmental scarcities and human violence
