The present work constitutes an effort to approach the subject of symbolic logic at the elementary to intermediate level in a novel way. The book is a study of a number of systems, their methods, their relations, their differences. In pursuit of this goal, a chapter explaining basic concepts of modern logic together with the truth table techniques of definition and proof is first set out. In Chapter 2, a kind of *ur* logic is built up and deductions are made on the basis of its axioms and rules. This axiom system, resembling a propositional system of Hilbert and Bernays, is called *P* since it is a positive logic, i.e., a logic devoid of negation. This system serves as a basis upon which a variety of further systems are constructed, including among others a full classical propositional calculus, an intuitionistic system, a minimum propositional calculus, a system equivalent to that of F.B. Fitch. Chapters 3 and 6. These are developed as axiomatic systems. By means of adding independent axioms to the basic system *P*, the notions of independence both for primitive functors and for axiom sets are discussed; the axiom sets for a number of such systems, e.g., Frege's propositional calculus, being shown to be non-independent. Equivalence and non-equivalence of systems are discussed in the same context. The deduction theorem is proved in Chapter 3 for all the axiomatic propositional calculi in the book. From the Standpoint of Modern Formal Logic Jan Lukasiewicz, 1957 *Aspects of Modern Logic* E.W. Beth, 2012-12-06

It is common to consider an area of science as a system of real or supposed truths which not only continuously extends itself but also needs periodical revision and therefore tests the inventive capacity of each generation of scholars anew. It sounds highly implausible that a science at one time would be completed, that at that point within its scope there would be no problems left to solve. Indeed, the solution of a scientific problem inevitably raises new questions so that our eagerness for knowledge will never find lasting satisfaction. Nevertheless, there is one science which seems to form an exception to this rule: formal logic, the theory of rigorous argumentation. It seems to have reached the ideal endpoint of every scientific aspiration already very shortly after its inception, using the work of some predecessors. Aristotle, or so it is at least assumed by many, has brought this branch of science once and for all to a conclusion. Of course, this doesn't sound that implausible. We apparently know what rigorous argumentation is; otherwise various sciences, in particular pure mathematics, would be completely impossible. And if we know what rigorous argumentation is, then it cannot be difficult to trace once and for all the rules which govern it. The unique subject of formal logic would therefore entail that this science, in variance with the rule which holds for all other sciences, has been able to
