Modern Inertial Technology:

Modern Inertial Technology Anthony Lawrence, 2012-12-06 Mechanical Engineering an engineering discipline borne of the needs of the industrial revolution is once again asked to do its substantial share in the call for industrial renewal The general call is urgent as we face profound issues of productivity and competitiveness that require engineering solutions among others The Mechanical Engineering Series features graduate texts and research monographs intended to address the need for information in contemporary areas of mechanical engineering The series is conceived as a comprehensive one that covers a broad range of concentrations important to mechanical engineering graduate education and research We are fortunate to have a distinguished roster of consulting editors on the advisory board each an expert in one of the areas of concentration The names of the consulting editors are listed on the next page of this volume The areas of concentration are applied mechanics biomechanics computational mechanics dynamic systems and control energetics mechanics of materials processing thermal science and tribology I am pleased to present this volume in the Series Modern Inertial Technology Navigation Guidance and Control Second Edition by Anthony Lawrence The selection of this volume underscores again the interest of the Mechanical Engineering series to provide our readers with topical monographs as well as graduate texts in a wide variety of fields

Modern Inertial Technology Anthony Lawrence, 2012-12-06 Automatic navigation makes ocean going and flying safer and less expensive Safer because machines are tireless and always vigilant inexpensive because it does not use human navigators who are unavoidably highly trained and thus expensive people What is more unmanned deep space travel would be impossible without automatic navigation Navigation can be automated with the radio systems Loran Omega and the Global Positioning System GPS of earth satellites but its most versatile form is completely self contained and is called inertial navigation It uses gyroscopes and accelerometers inertial sensors to measure the state of motion of the vehicle by noting changes in that state caused by accelerations By knowing the vehicle's starting position and noting the changes in its direction and speed one can keep track of the vehicle's present position Mankind first used this technology in World War II in guided weapons where cost was unimportant only 20-30 years later did it become cheap enough to be used commercially The electronics revolution in which vacuum tubes were replaced by integrated circuits has dramatically altered the field of inertial navigation Early inertial systems used complex mechanical gimbal structures and mechanical gyroscopes with spinning wheels The gimbals allowed the gyroscopes to stabilize a mass called a platform so that it remained in a fixed attitude relative to a chosen coordinate frame even as the vehicle turned around any or all of its three major axes
