Conservation Chemistry Ted Lister, Janet Renshaw, 2004 This book is divided into three sections dealing with the conservation of plastics stone and wood It provides teaching and learning materials that deal with familiar chemistry in an unfamiliar context it also helps to show how the chemical sciences play a part in many unexpected areas of life Many people think of objects made of plastic as throwaway and do not consider them as collectable items or ones that might be found in museums In fact there are increasing numbers of plastic objects in museums as well as in private collections and many are increasing in value To give just one example some Barbi TM dolls can change hands for thousands of pounds it is also a misconception that plastics do not decay easily many of them do and this raises issues about how best to preserve them This section is set in a context of the collection care identification and display of objects in museums and by private collectors The section on stone focuses on a case study In order to prevent damage to a stone object conservation scientists sometimes surround the object with filter paper soaked in pure water This is called poulticing Conservation scientists at the British Museum wanted to investigate the poulticing process to see how effective it was at removing salts and to find out whether previous treatment of the stone affected the efficiency of the removal process The section on wood focuses on the Mary Rose a wooden Tudor warship that sank off Portsmouth in 1545 In 1982 the hull was raised and since then has been undergoing conservation treatment in a former dry dock at Portsmouth Over 19 000 artefacts were recovered The material processed here looks at the chemistry of the decay processes and the methods used to conserve the wood of the Mary Rose s hull and some of the other materials involved

What Should Schools Teach? Alka Sehgal Cuthbert, Alex Standis, 2021-01-07 The design of school curriculums involves deep thought about the nature of knowledge and its value to learners and society. It is a serious responsibility that raises a number of questions: What is knowledge for? What knowledge is important for children to learn? How do we decide what knowledge matters in each school subject? And how far should the knowledge we teach in school be related to academic disciplinary knowledge? These and many other questions are taken up in *What Should Schools Teach?* The blurring of distinctions between pedagogy and curriculum and between experience and knowledge has served up a confusing message for teachers about the part that each plays in the education of children. Schools teach through subjects but there is little consensus about what constitutes a subject and what they are for. This book aims to dispel confusion through a robust rationale for what schools should teach that offers key understanding to teachers of the relationship between knowledge, what to teach and their own pedagogy, how to teach and how both need to be informed by values of intellectual freedom and autonomy. This second edition includes new chapters on Chemistry, Drama, Music and Religious Education and an updated chapter on Biology. A revised introduction reflects on emerging discourse around decolonizing the curriculum and on the relationship between the knowledge that children encounter at school and in their homes.

Handbook of Archaeological Methods Herbert D. G. Maschner, Christopher Chippindale, 2005 The Handbook of Archaeological Methods comprises 37 articles by leading archaeologists on the key methods used by archaeologists in the field in analysis, in theory building and in managing cultural resources. The book is destined to become the key reference work for archaeologists and their advanced students on contemporary archaeological methods.

our eternal quest to know the natural world **Global Atmospheric Chemical Change** C.N. Hewitt, W.T. Sturges, 2013-11-11 Air pollution has historically been viewed as a local or regional scale problem with attention focused on acute episodes such as the sulphur dioxide and smoke smogs of London in the 1950s and 1960s and the photochemical smogs of southern California first recognized by Haagen Smit in the early 1950s In recent years however it has become apparent that human activity has and still is changing the chemical composition of the atmosphere on a global scale The composition of the atmosphere has seen enormous changes due to natural processes since the formation of the planet Data obtained from air bubbles trapped in polar ice are beginning to reveal information about these changes over the last tens of thousands of years and geochemical models of the evolution of the Earth give us insights into the changes over much longer periods of time Perhaps the crucial differences between these natural changes and those now being induced by man are their relative rates of change The magnitude of present day fluxes of some compounds released as air pollutants is in some cases much larger than those arising naturally In other cases for example carbon dioxide the anthropogenic emission rates are small compared with that of the natural cycle but the kinetics of the system are such that the steady state concentrations of the compounds in the atmosphere are now being perturbed **A History of Modern Chemistry** Noboru Hirota, 2016 This publication is a translation of the book entitled Gendai Kagakushi A History of Modern Chemistry published by Kyoto University Press in 2013 **Biomedical Waste Management** Neha Suyal, Prasenjit Debbarma, Manali Singh, Anita Mishra, Roop S.
