electronics professional who has insight into the subject matter not shared by others These explanations are often written in an abstract manner that causes confusion as to the principles use and application Explanations then are often not sufficiently detailed or extensive enough to make the reader aware of the wide range of applications and different aspects of the principle being studied The numerous possible variations of principles and their applications are usually not discussed and it is left to the reader to discover this while doing exercises Accordingly the average student is expected to rediscover that which has long been established and practiced but not always published or adequately explained The examples typically following the explanation of a topic are too few in number and too simple to enable the student to obtain a thorough grasp of the involved principles The explanations do not provide sufficient basis to solve problems

Fundamentals of the Physical-Chemistry of Pulverized Coal Combustion L Lahaye, G. Prado, 2012-12-06 The study of coal for the production of energy is certainly not a new area of research Many research works were carried out to improve the efficiency of industrial and domestic facilities In the sixties however because of the availability and low cost of petroleum coal consumption decreased and the research effort in this area was minimum Meanwhile the situation has totally changed Considering the reserves of oil and the instability of regions where they are located it is becoming absolutely necessary to develop other sources of energy The major alternative to oil appears to be coal at least for the near future Indeed the reserves known today represent several centuries of energy consumption it is therefore becoming urgent to develop efficient and non polluting technologies to produce energy

from coal The main possibilities are liquefaction gasification directed combustion Research and development efforts on liquefaction have been considerably reduced because of high cost of technologies involved and poor prospects for the next two decades Research works on gasification are progressing it is a promising approach However direct combustion either in pulverized coal furnaces or in fluidized beds is the more promising way of expanding rapidly the utilization of coal These techniques are already used in some facilities but many environmental problems remain slowing down their development
