Physiologic Disposition of Drugs of Abuse Louis Lemberger, Alan Rubin, 1976 Psychopharmacology Bulletin , 1983

Psychoactive Drugs A. J. Goudie, M. W. Emmett-Oglesby, 1989-09-01 Research into the processes of tolerance and sensitization has escalated at a substantial rate in recent years presumably because of the fundamental importance of understanding the long term as opposed simply to the initial acute effects of drugs The rapid of such research in recent years is documented clearly by growth the editors in the introductory chapter to this text However despite the fact that there is a very large amount of literature concerned with the effects of long term drug treatment there is to the best of our knowledge no published text that has ever attempted to integrate some of the many diverse findings that have been made in this area Basic research has uncovered a number of different mechanisms by which tolerance and sensitization to drugs can develop Such mechanisms are of very different types involving psychological behavioral metabolic neuronal and subcellular processes Because of the complexity of each of these different types of mechanisms with few exceptions individual researchers usually tend understandably to concentrate on their own specific areas of expertise paying relatively little attention to relevant research occurring in other areas Consequently they neglect or simply ignore the important question of the relative importance of the specific mechanism that they are studying and the related question of the possible interrelationships that may exist between different mechanisms for the production of tolerance and sensitization Toxicology Research Projects Directory , 1978 **Toxicology in the Use, Misuse, and Abuse of Food, Drugs, and Chemicals** P.L. Chambers, S. Gitter, C.M. Chambers, 2012-12-06 Many chemotherapeutic agents introduced for use in humans are carcinogenic in laboratory animals Conklin et al 1965 Shimkin et al 1966 Griswold et al 1968 Harris 1976 However initially their beneficial effect in disseminated cancer was of such short duration that the inevitable death of the patient from his primary disease precluded any clinical manifestation of the carcinogenic potential During the last decade chemotherapy has radically changed the outlook for many patients with cancer Combinations of drugs administered as the primary treatment have resulted in high rates of cure in patients with disseminated malignancies such as stage IV Hodgkin's disease or childhood acute lymphocytic leukemia In other disseminated forms of neoplasia induction of a remission a substantial palliation and a prolongation of survival have been achieved In many instances of localized disease where surgery with or without radiotherapy are the primary form of treatment anticancer drugs have been used with success as adjuvant therapy for distant microscopic disease With these spectacular achievements secondary malignancies in particular acute non lymphocytic leukemia ANLL has become of major concern Incidence Acute leukemia is the most frequent form of secondary neoplasia in patients treated for cancer Penn 1981 In one large series 5.9% of all ANLL could be attributed to previous chemotherapy Kapadia et al 1980 **Current Catalog** National Library of Medicine (U.S.), First multi year cumulation covers six years 1965-70 *Cocaine* Matthew P.
