Biological Aspects of Radiation Protection T. Sugahara, O. Hug, 1971 In the maintenance and development of sound standards of radiation protection many types of enquiry are important These range from the purely technical examination of the ways in which exposure may occur or radionuclides may enter the body under existing or new conditions of occupational activity to the most fundamental studies of the interaction of high energy particulate radiation with matter or the metabolic localisation and kinetics of unfamiliar radionuclides One of the most important and most basic problems however is to establish a quantitative estimate for the frequency with which various types of injury would be induced in man following exposure to low doses of radiation delivered at low dose rates No sound limits can be proposed for appropriately safe levels of occupational or population exposure unless the associated hazard or its maximum likely value can be at least approximately assessed It is one of the most important tasks of those concerned with radiation protection that these criteria should be kept under constant review in the light of developing knowledge and that the fields in which further information is needed should be defined and described

Understanding Radiation Biology Kenneth Chadwick, 2019-11-15 This book provides a qualitative and quantitative exploration of the action of radiation on living matter which leads to a complete and coherent interpretation of radiation biology It takes readers from radiation induced molecular damage in the nucleus of the cell and links this damage to cellular effects such as cell killing chromosome aberrations and mutations before exploring organ damage organism lethality and cancer induction It also deals with radiological protection concepts and the difficulties of predicting the dose effect relationship for low dose and dose rate radiation risk The book ends with separate chapters dealing with the effects of UV light exposure and risk classification of chemical mutagens both of which are derived by logical extensions of the radiation model This book will provide the basic foundations of radiation biology for undergraduate and graduate students in medical physics biomedical engineering radiological protection medicine radiology and radiography Features Presents a comprehensive insight into radiation action on living matter Contains important implications for radiological protection and regulations Provides analytical methods for applications in radiotherapy

The Future of Low Dose Radiation Research in the United States National Academies of Sciences, Engineering, and Medicine, Division on Earth and Life Studies, Nuclear and Radiation Studies Board, 2019-12-13 Exposures at low doses of radiation generally taken to mean doses below 100 millisieverts are of primary interest for setting standards for protecting individuals against the adverse effects of ionizing radiation However there are considerable uncertainties associated with current best estimates of risks and gaps in knowledge on critical scientific issues that relate to low dose radiation The Nuclear and Radiation Studies Board of the National Academies hosted the symposium on The Future of Low Dose Radiation Research in the United States on May 8 and 9 2019 The goal of the symposium was to provide an open forum for a national discussion on the need for a long term

strategy to guide a low dose radiation research program in the United States The symposium featured presentations on low dose radiation programs around the world panel discussions with representatives from governmental and nongovernmental organizations about the need for a low dose radiation research program reviews of low dose radiation research in epidemiology and radiation biology including new directions and lessons to be learned from setting up large research programs in non radiation research fields This publication summarizes the presentation and discussion of the symposium
