A small vacuum equivalent is connected to capacitor with each section of the present tuning capacitors for impedance matching in the circuit. These small vacuum components for impedance matching in the circuit. The detector stage is considered as a diode, since the grid and the plate are connected together. Figure 112 is a circuit diagram of the detector stage.

3. In Figure 113, all grids of the T-F receiver are grounded, as shown, potential are denoted by heavy lines. All points on the heavy ground line will be at the same potential, which is considered to be zero with respect to the rest of the receiver circuit. All voltages in the circuit are compared to this ground potential.

5. In Figure 115, the high voltage for plate supply is shown by heavy lines. When the switch is closed, the first pentode receives the high positive plate voltage necessary for their action as amplifiers. The diode operating as a detector, does not require the plate voltage. The first amplifying sections in the plate leads of the first three pentodes.
