On and Off-Chip Crosstalk Avoidance in VLSI Design Chunjie Duan, Brock J. LaMeres, 2010-01-08 Deep Sub Micron DSM processes present many changes to Very Large Scale Integration VLSI circuit designers One of the greatest challenges is crosstalk which becomes significant with shrinking feature sizes of VLSI fabrication processes The presence of crosstalk greatly limits the speed and increases the power consumption of the IC design This book focuses on crosstalk avoidance with bus encoding one of the techniques that selectively mitigates the impact of crosstalk and improves the speed and power consumption of the bus interconnect This technique encodes data before transmission over the bus to avoid certain undesirable crosstalk conditions and thereby improve the bus speed and or energy consumption

Quick-Turnaround ASIC Design in VHDL N. Bouden-Romdhane,Vijay Madiseti,J.W. Hines,2012-12-06 From the Foreword Modern digital signal processing applications provide a large challenge to the system designer Algorithms are becoming increasingly complex and yet they must be realized with tight performance constraints Nevertheless these DSP algorithms are often built from many constituent canonical subtasks e g IIR and FIR filters FFTs that can be reused in other subtasks Design is then a problem of composing these core entities into a cohesive whole to provide both the intended functionality and the required performance In order to organize the design process there have been two major approaches The top down approach starts with an abstract concise functional description which can be quickly generated On the other hand the bottom up approach starts from a detailed low level design where performance can be directly assessed but where the requisite

design and interface detail take a long time to generate In this book the authors show a way to effectively resolve this tension by retaining the high level conciseness of VHDL while parameterizing it to get good fit to specific applications through reuse of core library components Since they build on a pre designed set of core elements accurate area speed and power estimates can be percolated to high level design routines which explore the design space Results are impressive and the cost model provided will prove to be very useful Overall the authors have provided an up to date approach doing a good job at getting performance out of high level design The methodology provided makes good use of extant design tools and is realistic in terms of the industrial design process The approach is interesting in its own right but is also of direct utility and it will give the existing DSP CAD tools a highly competitive alternative The techniques described have been developed within ARPAs RASSP Rapid Prototyping of Application Specific SignalProcessors project and should be of great interest there as well as to many industrial designers Professor Jonathan Allen Massachusetts Institute of Technology
