THE ACCULTURATION MODEL

Introduction

The Acculturation Model is one of the theories of second language acquisition proposed by John Schumann in 1978. The acculturation Model came into light by the practical study of Schumann on the non-English learners.

Definitions

The process of acculturation was defined by Brown as:

"the process of being adapted to a new culture" which involves a new orientation of thinking and feeling on the part of an L2 learner.

According to Oxford Learners' Dictionary, acculturation is:

"the process of learning to live successfully in a different culture; the process of helping somebody to do this. In other words, it stands for assimilation or digestion to a different culture, typically the dominant one".

Models Of Language Acquisition:

Computational Modeling of Human Language Acquisition Afra Alishahi, 2010-10-10 Human language acquisition has been studied for centuries but using computational modeling for such studies is a relatively recent trend. However, computational approaches to language learning have become increasingly popular mainly due to advances in developing machine learning techniques and the availability of vast collections of experimental data on child language learning and child-adult interaction. Many of the existing computational models attempt to study the complex task of learning a language under cognitive plausibility criteria such as memory and processing limitations that humans face and to explain the developmental stages observed in children. By simulating the process of child language learning, computational models can show us which linguistic representations are learnable from the input that children have access to and which mechanisms yield the same patterns of behaviour that children exhibit during this process. In doing so, computational modeling provides insight into the plausible mechanisms involved in human language acquisition and inspires the development of better language models and techniques. This book provides an overview of the main research questions in the field of human language acquisition. It reviews the most commonly used computational frameworks, methodologies, and resources for modeling child language learning and the evaluation techniques used for assessing these computational models. The book is aimed at cognitive scientists who want to become familiar with the available computational methods for investigating problems related to human language acquisition as well as computational linguists who are interested in applying their skills to the study of child language acquisition. Different aspects of language learning are discussed in separate chapters, including the acquisition of the individual words, the general regularities which govern word and sentence form, and the associations between form and meaning. For each of these aspects, the challenges of the task are discussed, and the relevant empirical findings on children are summarized. Furthermore, the existing computational models that attempt to simulate the task under study are reviewed, and a number of case studies are presented.

Models of Language Acquisition

Peter Broeder, Jaap Murre, 2000 This book presents recent advances by leading researchers in computational modelling of language acquisition. Sophisticated theoretical models can now be tested using simulation techniques and large corpora of linguistic data. Renewed interest in learning neural networks and the ability to test new solutions to fundamental problems has fuelled debates in an already very active field. The twenty-four authors in this collection of new work have been drawn from departments of linguistics, cognitive science, psychology, and computer science. The book as a whole shows what light may be thrown on fundamental problems when powerful computational techniques are combined with real data. A central question addressed in the book concerns the extent to which linguistic structure is readily available in the environment. The authors consider the evidence in relation to word boundaries and phonotactic structure, stress patterns, text-to-speech rules,

and the mapping of lexical semantics one author arguing that a child's own output may serve as a key source of linguistic input Linguistic structure environment relations are central to the debate on the degree to which language learning is inductive or deductive this issue is considered here in studies of the acquisition of pluralization and inflectional morphology The book examines the power and utility of different modeling formalisms for different problems and approaches how far for example can connectionist models be used as models for language acquisition or Simple Recurrent Networks form the basis of a model of language acquisition To what degree can lexical items and categories be used in the construction of neural network models or Markov chains be deployed to investigate the characteristics of a general language learning algorithm Triggering Learning Algorithm This book will appeal to linguists psychologists cognitive scientists working in language acquisition It will also interest those involved in computational modelling in linguistics and behavioural science *Models of Language Use and Language Learning in the Theory of Language Didactics* Maria Dakowska, 1995 *A Computational Model of Language Acquisition in the Two-year-old* Jane Anne Collins Hill, 1983 **Manual of Language Acquisition** Christiane Fäcke, 2014-08-25 This manual contains overviews on language acquisition and distinguishes between first and second language acquisition It also deals with Romance languages as foreign languages in the world and with language acquisition in some countries of the Romance speaking world This reference work will be helpful for researchers students and teachers interested in language acquisition in general and in Romance languages in particular *Encyclopedia of Language Development* Patricia J. Neural Models of language Processes

Michael Arbib, 2012-12-02

Neural Models of Language Processes offers an interdisciplinary approach to understanding the nature of human language and the means whereby we use it

The book is organized into five parts

Part I provides an opening framework that addresses three tasks to place neurolinguistics in current perspective to provide two case studies of aphasia and to discuss the rules of the game of the various disciplines that contribute to this volume

Part II on artificial intelligence AI and processing models discusses the contribution of AI to neurolinguistics

The chapters in this section introduce three AI systems for language perception the HWIM and HEARSAY systems that proceed from an acoustic input to a semantic interpretation of the utterance it represents and Marcus9 system for parsing sentences presented in text

Studying these systems demonstrates the virtues of implemented or implementable models

Part III on linguistic and psycholinguistic perspectives includes studies such as nonaphasic language behavior and the linguistics and psycholinguistics of sign language

Part IV examines neurological perspectives such as the neuropathological basis of Broca's aphasia and the simulation of speech production without a computer

Part V on neuroscience and brain theory includes studies such as the histology architectonics and asymmetry of language areas hierarchy and evolution in neurolinguistics and perceptual motor processes and the neural basis of language
