

Models of Psychopathology

models— a set of assumptions and concepts that help scientists explain and interpret observations

-also called a paradigm

the biological model

-biological theorists view abnormal behavior as an illness brought about by malfunctioning parts of the organism

-typically, they point to problems in brain anatomy, brain chemistry, and/or brain circuitry as the cause

▼ **brain anatomy and abnormal behavior**

-the brain is made up of approx. 86 billion nerve cells— **neurons**

-thousands of billions of support cells— **glia**

-within the brain, large groups of neurons form distinct regions called brain structures

-the neurons in each of these brain structures help control important functions

-clinical researches have linked particular psychological disorders to problems in specific structures of the brain

huntingtons disease— disorder marked by involuntary body movements, violent emotional outbursts, memory loss, suicidal behavior, and absurd beliefs

-loss of cells in the basal ganglia and cortex

▼ **brain chemistry and abnormal behavior**

-information communicated through the brain in the form of electrical impulses that travel from one neuron to others or one

-electrical impulse travels down the sending neurons axon to its nerve ending, where neurotransmitters are released and carry the message across the synaptic

Models Of Psychopathology:

Models Of Psychopathology Dilys Davies, Dinesh Bhugra, 2004-05-16 Models and theories of psychopathology and their associated clinical practice do not represent scientific fact so much as a variation in perspective within psychopathology itself. Several favoured models exist within any society at a given time and as well as changing historically over time they also differ culturally between societies. This book examines the similarities, differences and points of integration in the main models of psychopathology, how the theoretical conceptualizations underpinning these models are reflected in the theory and the clinical practice of different schools of psychotherapy, how various models are used in everyday practice, whether clinicians adhere to the rules of a given model or whether in fact there is more integration in practice than there appears to be in theoretical conceptualizations. *Models of Psychopathology* is aimed at advanced undergraduates and postgraduate students of clinical psychology, counselling psychology, psychotherapy and counselling. It will also be of interest to therapy students in professional training courses and experienced clinicians who want to know more about this aspect of psychotherapy.

Models of Psychopathology Lisa M. Hooper, Luciano L'Abate, Laura G. Sweeney, Giovanna Ganesini, Peter J. Jankowski, 2013-10-11 This book explores current relational models of psychopathology that undergird a great many conflicts and destructive outcomes in family and intimate relationships. These models have similar features and can be considered as a group. They are all 1) generational, 2) relational and 3) fundamentally reactive processes stemming from existing psychopathology.

Dimensional Models of Personality Disorders Thomas A. Widiger, Paul J. Sirovatka, Darrel A. Regier, Erik Simonsen, 2007-05-03 DSM IV and ICD 10 both diagnose personality disorders categorically yet studies indicate that many patients meet criteria for an excessive number of diagnoses, raising the question of whether personality disorders are discrete conditions or rather distinctions along dimensions of general personality functioning. This collection of papers renews long standing proposals for a dimensional model of personality disorder, describing alternative models, addressing questions about their clinical application and utility, and suggesting that future research seek to integrate such models within a common hierarchical structure. With contributions by preeminent researchers in the field, *Dimensional Models of Personality Disorders* is drawn from a conference series convened by APA, WHO and NIH in order to plan for the fifth edition of the DSM. The Nomenclature Work Group concluded that consideration should be given to basing part or all of DSM V on dimensions rather than categories and recommended that a dimensional model for personality disorders should serve as a basis for exploring dimensional approaches in other areas. Accordingly, the volume opens with a presentation of 18 proposals for dimensional models and proceeds with provocative contributions on a number of related issues ranging from hard science to clinical practice. Among the topics addressed are behavioral and molecular genetic research supporting an etiologically informed dimensional classification of personality disorders. The as yet tenuous associations between dimensional trait measures of personality as contained in the

models of Cloninger Depue and Siever Davis and specific neurobiological measures as examined in neurotransmitter research Potential links between childhood and adolescent temperament and personality dimensions and adult personality psychopathology Studies examining the covariation of personality dimensions across cultures The continuity of Axis I and Axis II disorders and a proposed hierarchical structure of mental disorders that integrates the psychopathology of Axis I disorders with specific personality traits The dual challenges of coverage and cutoffs that must be addressed if dimensional models are to be considered viable alternatives to the existing categorical diagnostic system Although the editors acknowledge that concerns are certain to be raised regarding conversion to a dimensional classification such as the disruption to clinical practice by a radical shift in diagnosing personality disorder these papers make a strong case for opening the field to alternative ways of enhancing clinical utility and improving the validity of basic classification concepts Together they offer stimulating insight into how we approach personality disorders with the hope of encouraging a new model of diagnosis for DSM V

Behavioral Models in Stress Research Allan V. Kalueff, Justin L. LaPorte, 2008 Stress is an adaptive response that has developed throughout evolution and is associated with multiple changes in the biochemistry histology and physiology of an organism As stress may induce or contribute to multiple neuropsychiatric disorders the rigorous investigation of the neural substrates of stress has become a critical endeavour of contemporary biomedical science This book explores the physiological responses that researchers have attempted to assess in stress evoked behavioural changes using both human and animal experimental models in clinical and non clinical research Though all aspects of the field have their challenges animal experimental research of stress is a particularly difficult but meaningful task This book provides succinct and relevant summaries of progress in the area of assessing stress response and the conditions contributing to it
