**Financial and Insurance Formulas** Tomas Cipra, 2010-07-16 Financial and insurance calculations become more and more frequent and helpful for many users not only in their profession life but sometimes even in their personal life Therefore a survey of formulas of financial and insurance mathematics that can be applied to such calculations seems to be a suitable aid In some cases one should use instead of the term formula more suitable terms of the type method procedure or algorithm since the corresponding calculations cannot be simply summed up to a single expression and a verbal description without introducing complicated symbols is more appropriate The survey has the following ambitions The formulas should be applicable in practice it has motivated their choice for this survey first and foremost On the other hand it is obvious that by time one puts to use in practice seemingly very abstract formulas of higher mathematics e g when pricing financial derivatives evaluating financial risks applying accounting principles based on fair values choosing alternative risk transfers ARL in insurance and the like The formulas should be error free though such a goal is not achievable in full since in the financial and insurance framework one publishes sometimes in a haphazard way various untried formulas and methods that may be incorrect Of course the formulas are introduced here without proofs because their derivation is not the task of this survey *Modern Actuarial Risk Theory* Rob Kaas, Marc Goovaerts, Jan Dhaene, Michel Denuit, 2009-09-30 Modern Actuarial Risk Theory contains what every actuary needs to know about non life insurance mathematics It starts with the standard material like utility theory individual and collective model and basic ruin theory Other topics are risk measures and premium principles bonus malus systems ordering of risks and credibility theory It also contains some chapters about Generalized Linear Models applied to rating and IBNR problems As to the level of the mathematics the book would fit in a bachelors or masters program

in quantitative economics or mathematical statistics This second and much expanded edition emphasizes the implementation of these techniques through the use of R This free but incredibly powerful software is rapidly developing into the de facto standard for statistical computation not just in academic circles but also in practice With R one can do simulations find maximum likelihood estimators compute distributions by inverting transforms and much more
