Ionic Soft Matter: Modern Trends in Theory and Applications Douglas Henderson, Myroslav Holovko, Andriy Trokhymchuk, 2006-06-30 Recently there have been profound developments in the understanding and interpretation of liquids and soft matter centered on constituents with short range interactions Ionic soft matter is a class of conventional condensed soft matter with prevailing contribution from electrostatics and therefore can be subject to possible long range correlations among the components of the material and in many cases crucially affecting its physical properties Among the most popular representatives of such a class of materials are natural and synthetic saline environments like aqueous and non aqueous electrolyte solutions and molten salts as well as variety of polyelectrolytes and colloidal suspensions Equally well known are biological systems of proteins All these systems are examples of soft matter strongly influenced if not dominated by long range forces For more than half of century the classical theories by Debye and Hückel as well as by Derjaguin Landau Verwey and Overbeek DLVO have been at the basis of theoretical physical chemistry and chemical engineering The substantial progress in material science during last few decades as well as the advent of new instrumentation and computational techniques made it apparent that in many cases the classical theories break down New types of interactions e.g. hydrodynamic entropic have been discovered and a number of questions have arisen from theoretical and experimental studies Many of these questions still do not have definite answers
