

Fundamental concepts of Geomorphology

Concept 1. The same physical processes and laws that operate today operated throughout geologic time, although not necessarily always with the same intensity as now.

This is the great underlying principle of modern geology and is known as the *principle of uniformitarianism*. It was first enunciated by Hutton in 1785 and popularized by Lyell in the numerous editions of his *Principles of Geology*. Hutton taught that "the present is the key to the past," but he applied this principle somewhat too rigidly and argued that geologic processes operated throughout geologic time with the same intensity as now. We know now that this is not true. Glaciers were much more significant during the Pleistocene and during other periods of geologic time than now; world climates have not always been distributed as they now are, and, thus, regions that are now humid have been desert and areas now desert have been humid; periods of crustal instability seem to have separated periods of relative crustal stability, although there are some who doubt this; and there were times when volcanism was more important than now. Numerous other examples could be cited to show that the intensity of various geological processes has varied through geologic time, but there is no reason to believe that streams did not cut valleys in the past as they do now; that the more numerous and more extensive valley glaciers of the Pleistocene behaved any differently from existing glaciers; that the winds which deposited the Navajo sandstone during Tertiary times obeyed any different laws from those which control wind movements today. Groundwater opened up solutional passageways in limestones and other soluble rocks and formed surface depressions which we now call sinkholes during the Permian and Pennsylvanian periods as it does today in many parts of the world. Without the principle of uniformitarianism there could hardly be a science of geology that was more than pure description.

Concept 2. Geologic structure is a dominant control factor in the evolution of land forms and is reflected in them.

structure, process, and stage are the major control factors in the evolution of land forms. The term *structure* as it is used in geomorphology is not applied in the narrow sense of such rock features as *folds*, *faults*, and *unconformities* but it includes all those ways in which the earth materials out of which land forms are carved differ from one another in their physical and chemical attributes. It includes such phenomena as rock attitudes; the presence or absence of *joints*, *bedding planes*, *faults*, and *folds*; rock massiveness; the physical hardness of the constituent minerals; the susceptibility of the mineral constituents to chemical alteration; the permeability or impermeability of rocks; and various other ways by which the rocks of the earth's crust differ from one another. The term
