Radiation Doses Effects Risks:

Radiation United Nations Environment Programme, 1985 Few scientific issues arouse as much public controversy as the effects of radiation This booklet is an attempt to summarize what is known about radiation and provide a basis for further discussion and debate The first four chapters of the booklet are based on the most recent reports to the United Nations General Assembly by the United Nations Scientific Committee on the Effects of Atomic Radiation UNSCEAR These chapters deal with 1 radiation and life 2 natural sources of radiation 3 human made sources of radiation and 4 the effects in humans of radiation The final chapter is an attempt to discuss the issue of acceptability of risks from radiation a subject not addressed in the UNSCEAR reports TW Radiation Geoffrey Lean, 1985 **Dose, Benefit, and Risk in Medical Imaging**

Lawrence T. Dauer, Bae P. Chu, Pat B. Zanzonico, 2018-10-11 This timely overview of dose benefit and risk in medical imaging explains to readers how to apply this information for informed decision making that improves patient outcomes The chapters cover patient and physician perspectives referral guidelines appropriateness criteria and quantifying medical imaging benefits The authors have included essential discussion about radiologic physics in medical imaging fundamentals of dose and image quality risk assessment and techniques for optimization and dose reduction The book highlights practical implementation aspects with useful case studies and checklists for treatment planning Clinicians students residents and professionals in medical physics biomedical engineering radiology oncology and allied disciplines will find this book an essential resource with the following key features Discusses risk benefit dose optimization safety regulation radiological protection and shared informed decision making Covers regulatory oversight by government agencies manufacturers and societies Highlights best practices for improving patient safety and outcomes Gives guidelines on doses associated with specific procedures *Engineering Risks* Ulrich Hauptmanns, Wolfgang Werner, 2012-12-06 Encouragement by colleagues and a considerable increase in the use of probabilistic analyses since the publication of the German edition in 1987 have motivated this English version A mere translation was inappropriate because a number of important studies completed in recent years had to be included among them the assessment of the risks of five nuclear power plants in the United States of America and the German Risk Study Phase B The opportunity was taken to elaborate on some concepts which have gained importance of late such as accident management An update of international safety goals was also made however this can only be a momentary view of a field subjected to frequent change Thanks are due to the Springer Verlag for the careful editing and production of the book Kaln Garching Ulrich Hauptmanns March 1990 Wolfgang Werner Preface to the German Edition With the increasing use of complex technologies there is a growing need to evaluate the associated risks The methodology of probabilistic safety and risk analysis allows predictive valuation of risks Nuclear engineering has been in the forefront of the development and application of this method In the Safety Study on US Power Plants published in 1975 the risk of an entire technology was investigated systematically and quantified for the first time Meanwhile the methods have continuously been

improved and applied to a number of nuclear power stations *Environmental Health* Kathryn Hilgenkamp, 2005

Environmental Health Ecological Perspectives is intended as an environmental health text for both undergraduate and graduate levels This text provides balanced coverage of how humans are affected by the quality of air water and food as well as how humans affect these survival necessities The evolution and prosperity of the human species has resulted in concerns about pollution overpopulation and several other issues that are having a harmful effect on humans and our environment This knowledge along with an understanding of the legislation and history of environmental issues will help students to make positive changes in their behavior and in the world around them **The Risks of Nuclear Energy Technology** Günter Kessler, Anke Vesper, Franz-Hermann Schlüter, Wolfgang Raskob, Claudia Landman, Jürgen Päsler-Sauer, 2014-08-22 The book analyses the risks of nuclear power stations The security concept of reactors is explained Measures against the spread of radioactivity after a severe accident accidents of core melting and a possible crash of an air plane on reactor containment are discussed The book covers three scientific subjects of the safety concepts of Light Water Reactors A first part describes the basic safety design concepts of operating German Pressurized Water Reactors and Boiling Water Reactors including accident management measures introduced after the reactor accidents of Three Mile Island and Chernobyl These safety concepts are also compared with the experiences of the Fukushima accidents In addition the safety design concepts of the future modern European Pressurized Water Reactor EPR and of the future modern Boiling Water Reactor SWR 1000 KERENA are presented These are based on new safety research results of the past decades In a second part the possible crash of military or heavy commercial air planes on reactor containment is analyzed It is shown that reactor containments can be designed to resist to such an airplane crash In a third part an online decision system is presented It allows to analyze the distribution of radioactivity in the atmosphere and to the environment after a severe reactor accident It provides data for decisions to be taken by authorities for the minimization of radiobiological effects to the population This book appeals to readers who have an interest in save living conditions and some understanding for physics or engineering *Low Dose Exposures in the Environment* C. Streffer, H. Bolt, D. Follesdal, P. Hall, J.G. Hengstler, P. Jacob, D. Oughton, K. Prieß, E. Rehbinder, E. Swaton, 2013-11-11 The ever increasing release of harmful agents due to human activities have led in some areas of the world to heavy pollution In order to protect human health and the environment environmental standards that shall limit the release and the concentration of those toxic agents in the environment and hence the exposure to it have to be established The related assessment and decision making procedures have to be based on solid scientific data about the effects and mechanisms of these agents as well as on ethical social and economic aspects For risk evaluation the knowledge of the dose response curve is an essential prerequisite Dose responses without a threshold dose are most critical in this connection Such dose responses are assumed for mutagenic and carcinogenic effects which therefore dominate also the discussion in this book In the environmentally important low dose range risk estimation can only be achieved by extrapolation from higher

doses with measurable effects The extrapolation is accompanied with uncertainties which makes risk evaluation as well as risk communication frequently problematic In order to ensure rational efficient and fair decisions beyond a sound scientific assessment the dialogue between disciplines with the affected people and with the general public is necessary In this book the whole range of relevant and essential aspects of risk evaluation and standard setting is addressed Starting with the ethical foundations the sound analysis of recent scientific findings sets the frame for further reflections by theory of cognition psychosocial sciences and jurisprudence The authors end up with concluding recommendations for coping with the recent problems of standard setting in the field of environmentally relevant low doses The book is designed to a readership of scientists legislators administrators and the interested public **Forensic Anthropology** Max M.
