**Dynamic Radiology of the Abdomen** M.A. Meyers, 2013-04-17 This book provides a systematic application of anatomic and dynamic principles to the practical understanding and diagnosis of intraabdominal diseases Anatomic sections and injection studies form a basis for understanding the characteristic features of many common and uncommon diseases and their spread and localization in the abdomen These relationships and specific criteria provide a rational system for accurate radiologic analysis in plain films conventional contrast studies ultrasonography and computerized transaxial tomography CTT This information leads to the uncovering of clinically deceptive diseases the evaluation of the effects of disease the anticipation of complications and the determination of the appropriate diagnostic and therapeutic approaches The introductory atlas presents full color anatomic cross sections of the abdomen and pelvis complemented by labeled tracings

and detailed CT scans at corresponding levels. The sections which are approximately 3.8 cm x 1.5 cm in thickness were obtained from fresh cadavers frozen in dry ice for 48 hours in order to maintain the true intimate anatomical relationships. The accompanying text of the atlas stresses normal gross relationships, common variants and the basis of their radiological identification particularly in plain films. The subsequent chapters deal with the diagnosis and the pathways of spread of infection, malignancies and traumatic and inflammatory effusions within the intra and extraperitoneal spaces. Emphasis is placed on the specific localizing features based on the anatomical planes and recesses and the dynamics of extension of disease.
